Section 1: Introduction

This document has been produced by the Department of Planning, Transport, and Infrastructure (DPTI) and complies with Australian Standard 1742.3 (Traffic Control for Works on Roads) and the South Australia Road Traffic Act, 1961. It is the standard for the road worker industry when working on all roads in South Australia. It is also a reference document for the road worker industry participants attending the Workzone Traffic Management training course.

Please note, this document may not cover all instances and therefore you will need to refer to AS 1742.3, subject to any provision of the South Australia Road Traffic Act, 1961 and Regulations.

Under the South Australia Road Traffic Act, 1961 approval is required to place traffic control devices on the road. This approval has been passed to authorities, subject to varying conditions (refer to clause 2.4). Note that one of these conditions is the successful completion of a DPTI approved Workzone Traffic Management training course (refer to clause 2.6).

1.1 References

The following documents have been used to develop the SA Standards for Workzone Traffic Management:

- South Australia Road Traffic Act, 1961 and Regulations
- Work Health Safety Act, 2012 and Regulations
  - Part One – Legal Responsibilities (The Instruments)
  - Part Two – Technical Requirements (The Code)
- Field Guide – Traffic Control Devices for Workzone Traffic Management (Field Guide)

1.2 Definitions

For the purpose of this document the following terms are used:

Accredited officer: A person who has:
- authority delegated by Commissioner of Highways to place, move and remove traffic control devices on or above roads in South Australia; and
- through a combination of training, qualification and experience, acquired knowledge and skills enabling them to correctly perform a specified task.

Built-up area: Roadside development comprising property accesses at spacings averaging less than 100 m over distances of at least 500 m.

Competent person: A non accredited person who has been delegated specific task/s under the direction of an ‘accredited officer’.

Day time: The daylight hours between the official times of sunrise and sunset.

During these hours conditions may be so poor that there is not enough natural light for the daytime rules to apply. In such circumstances, it is recommended that traffic controls meet night time requirements.

Delineate: To mark out temporary pathways for traffic to follow through a section of roadwork.

Dimension D: A distance expressed in metres, used for the positioning of advance signs and related purposes.

See 5.5.1 for the calculation of D.

DPTI: South Australian Department for Planning, Transport and Infrastructure (DPTI).

Expressway: A divided road for through traffic with full or partial control of access and generally with grade separation at intersections. The term includes expressways, freeways, tollways and motorways (as defined in AS 1348).
Frangible

Capable of being broken; frangible materials shall be used for posts or other supports for signs and devices which could otherwise injure road users.

Hazardous work area

A work area where:

- workers may be working on a part of a roadway for vehicles travelling in a particular direction where there is no adjoining marked lane outside the work area for vehicles proceeding in the same direction;

- workers may be working less than 1.5 metres from vehicles travelling on a roadway, and the work is carried out on foot and not exclusively through the use of vehicles; and/or

- an unusually high level of hazard for persons using the road is created as a consequence of the existence of the work area.

Note: This definition extends to include all road users including pedestrians and cyclists.

Long-term

A description which applies when a traffic guidance scheme must operate both day and night and may be left unattended.

May

Indicates the existence of an option.

Median

The portion of a divided highway separating carriageways transporting traffic travelling in opposite directions.

Multi-lane

Two or more traffic lanes in one direction.

Night time

The night hours between the official times of sunset and sunrise.

Open road area

Roadside development less frequent than that specified for a built-up area.

Risk management

Process for managing risks by identifying, analysing, evaluating, recording, monitoring, treating and reporting risks according to ISO 31000.

Road

An area that is open to or used by the public. It is developed for (or has as one of its main uses) the driving of motor vehicles and includes road related areas.
Road safety barrier
A physical barrier separating the work area and the travelled path, designed to resist penetration by an out-of-control vehicle and as far as practicable, to redirect vehicles back into the travelled path.

Road user
Any driver, rider, passenger or pedestrian using the road, including people with disabilities.

Road related area
Any of the following:
- an area that divides a road;
- a footpath or nature strip adjacent to a road;
- an area that is not a road and that is open to the public and designated for use by cyclists or animals;
- an area that is not a road and that is open to or used by the public for driving or parking vehicles; or
- any other area that is open to or used by the public and that has been declared by regulation to be a road-related area.

Roadway
Portion of the road devoted particularly to the use of vehicles, including shoulders and auxiliary lanes.

Roadwork
Can mean any of the following:
- construction or maintenance of a road;
- road cleaning;
- installation or maintenance of a traffic related item, traffic monitoring device, or traffic control device (excluding temporary devices such as traffic cones);
- a road surface survey test; or
- installation and maintenance of utilities on, above, or near a road (e.g. electricity, gas, sewerage or telecommunications).

Roadwork speed limit
A speed limit indicated for a work site and where work is being carried out or along a work area.

Shall
Indicates that a statement is mandatory.

Short-term
A work site where a traffic guidance scheme is required only while work personnel are in attendance and is generally limited to a single work shift where road conditions are returned to normal when the shift ends.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Should</td>
<td>Indicates a recommendation.</td>
</tr>
<tr>
<td>Sight distance</td>
<td>The distance measured along the carriageway over which objects of defined height are visible to a driver.</td>
</tr>
<tr>
<td>Speed of traffic</td>
<td>The speed limit applying at a location or an estimate of the speed of the majority of vehicles in the stream if considered to be significantly different (a variation of 10 km/h) from the speed limit either above or below.</td>
</tr>
<tr>
<td>Static work site</td>
<td>All works which are greater in scope and duration than can be handled by short-term, low impact provisions or by mobile works.</td>
</tr>
<tr>
<td>Traffic</td>
<td>All vehicles, persons or animals travelling on a road unless the context indicates otherwise.</td>
</tr>
<tr>
<td>Traffic control device</td>
<td>Any sign, signal, pavement marking or other installation placed or erected to regulate, warn or guide traffic (note: this includes traffic cones and temporary bollards).</td>
</tr>
<tr>
<td>Traffic controller</td>
<td>A trained person whose duty it is to control traffic at a work site. This control is normally exercised by the use of a Stop/Slow Bat.</td>
</tr>
<tr>
<td>Traffic guidance scheme</td>
<td>An arrangement of temporary signs and devices to warn road users and guide them through or past a work site or temporary hazard.</td>
</tr>
<tr>
<td>Traffic management plan</td>
<td>A detailed traffic guidance scheme that is prepared by following a risk based procedure that considers all essential traffic management matters in an ordered way. Works involving complex traffic arrangements or staged works shall prepare a fully documented traffic management plan.</td>
</tr>
<tr>
<td>Travelled path</td>
<td>That part of the roadway which is made available to vehicles and which may comprise one or more trafficable lanes.</td>
</tr>
<tr>
<td>Two-way roadway</td>
<td>A roadway having traffic lanes allotted for use by traffic in opposing directions with or without either physical separation or a painted median between them.</td>
</tr>
<tr>
<td>Unsealed road</td>
<td>A road surface that is not sealed i.e. with asphalt, concrete.</td>
</tr>
<tr>

<td>A portion of road on which workers are, or may be, engaged.</td>
</tr>
<tr>
<td>Work site</td>
<td>A portion of road affected by works in progress, together with any additional portion of road used to regulate traffic in relation to those works or for associated purpose.</td>
</tr>
</tbody>
</table>
Section 2: South Australian legal requirements

2.1 Legislation

The conditions under which people are permitted to work on roads are governed by legislation and associated standards and codes of practice. This section deals with the legal requirements at work sites.

It is important to assess every work site to determine the traffic control devices needed and be sure that the minimum requirements are met. There are strict requirements covering approval for placing traffic control devices.

The following Acts, Regulations, Codes and Standards relate to works on roads. It is the responsibility of all organisations to ensure they have the latest version of these documents.

2.2 Work Health Safety Act, 2012 and Regulations

Every worker and every workplace on or near a road are covered under the Work Health Safety (WHS) Act, 2012 and Regulations. This Act and Regulations requires both persons conducting businesses or undertakings, and workers, to undertake certain duties to ensure that all workplaces are safe.

Under the Act, SafeWork SA inspectors have the power to impose heavy fines on both employers and employees found in breach of the Act. Where an inspector considers that an immediate danger exists to the health or safety of a worker, other workers or the public, then an order can be given to stop work immediately, or stop all works on site until the problems are corrected. Inspectors are active throughout South Australia.

2.3 South Australia Road Traffic Act, 1961 and Regulations

Traffic control devices shall be installed, maintained, altered, operated and removed with the proper approval. Without this approval the person is guilty of an offence under Section 21 of the Act, which carries a maximum penalty of $5 000 or imprisonment for one year.

Under Section 17 (1) and (2) of the Act, a road authority requires approval from the Minister for Transport to install, maintain, alter, operate or remove a traffic control device on a road.

Under Section 17 (3) of the Act, any authority, body or person requires approval from the Minister for Transport to install, display, alter, operate or remove traffic
control devices in relation to works on a road, temporary road closures, or for any temporary purposes.

Under Section 20 of the Act, a public authority requires approval from the Minister of Transport to place speed limit signs on the road. This section also defines the speed limit that shall be used at a work site or work area.

Approval by the Minister for Transport for the Sections above is given through ‘The Instruments’.

2.1 The Manual of Legal Responsibilities and Technical Requirements for Traffic Control Devices

There are two parts to ‘The Manual’; firstly ‘The Instruments’ which set out the legal requirements for the variations from the Act for the use of traffic control devices in South Australia. Please note, The Instruments shall be read in conjunction with the other documents it references.

If the conditions in The Instruments, which include roadworks, cannot be met then separate approval shall be sought from the Commissioner of Highways. Supporting documentation, a traffic impact statement and other conditions specified in The Instruments shall be included in the application.

The second part of The Manual is ‘The Code’ which amends some aspects of the Australian Standards and Austroads Guides where South Australia’s practices differ. Authorities and authorised persons shall comply with all relevant standards and guides, as varied by The Code.

It is the responsibility of the organisation to ensure they have the latest version of The Manual as amendments occur from time to time.

This publication is issued by the Traffic and Access Standards Section of DPTI, located at 77 Grenfell Street, Adelaide SA.

2.2 The Instrument of General Approval and Delegation (‘The Instruments’)

The Minister has delegated powers and granted approvals through the Instruments to the:

- Commissioner of Highways;
- Commissioner of Police;
- Adelaide Airport Limited;
- accredited railway owners;
- Board of the Botanic Gardens and Herbarium; and
- Councils.
The above authorities can delegate functions from the Minister subject to conditions contained in the specific 'Instruments' to authorised positions within the individual organisations. These Instruments are included as the first part (the Legal Responsibilities) of ‘The Manual of Legal Responsibilities and Technical Requirements for Traffic Control Devices’.

Persons or bodies who are not a road authority (i.e. statutory bodies like SA Water and SA Power Networks) whose workplace is on a road, are authorised by the Commissioner of Highways to use traffic control devices temporarily, subject to the conditions stated in The Instrument from the Commissioner of Highways to grant general approval for the temporary use of traffic control devices by personnel other than road authorities.

### 2.3 Training and accreditation

DPTI has developed the South Australian ‘Workzone Traffic Management’ training course to ensure that personnel who are required to work on roads are aware of their responsibilities and legal obligations. The training course will also ensure that these personnel are aware of the traffic control devices that are available for use and how to use them to provide a safe working environment for their own benefit and that of the general public.

The course carries a formal three year accreditation period. To maintain accreditation, retraining in the DPTI Workzone Traffic Management training course must be undertaken every three years.

At all times that workers are present at a work site, at least one worker must:

- Have attained accreditation in the DPTI Workzone Traffic Management training course; and
- Carry a current card certifying accreditation of this course when engaged at a work area or work site.

It is through this accreditation that a worker is declared an accredited officer and has the authority to place, move and remove traffic control devices. These tasks may be delegated by an accredited officer to a competent person.

It is an offence under the South Australia Road Traffic Act, 1961 not to carry a card certifying current accreditation.

### 2.4 Working on roads under DPTI control

When working on or adjacent to a road, the appropriate road authority shall be notified before any roadworks commence. Roads under DPTI control require a permit to be obtained from the appropriate regional office prior to starting any works. Section 2.7.1 of this document details the approval process.

Highways, expressways and freeways and most arterial roads are under the control of DPTI who adopts procedures that ensure:
roads under it’s care are kept in the best possible condition; and
traffic is properly managed during any works.

Key points from the specification that shall be considered include:

- Provision of adequate notification of the works to DPTI. Four weeks notice in advance for major works and six weeks notice if services are being fixed to a bridge. Applications and permit numbers are required for all works.
- Provision of adequate notice to the public, including businesses and residences where necessary.
- Provision of advice to emergency services and bus operators, if delays may be expected to their services.
- Check for the location of all underground services (including lighting and traffic signal installations).
- Allow for the safety of all road users during the works (as discussed in this document).

When applying for a permit number, use the forms prescribed by DPTI (see Appendix A).

An accredited officer shall remain on site at all times while work is carried out.

Unless otherwise approved by the relevant DPTI Regional Manager or representative, the following restrictions apply:

- No works shall be carried out on peak flow traffic lanes between 7.00 am and 9.00 am or between 4.00 pm and 6.00 pm; and
- As a minimum, one half of the roadway shall remain open to traffic at all times.

2.4.1 Notification of works

Notification to the DPTI Regional Manager or representative when work is undertaken on, along or across any road pavement or shoulder which is maintained by the Commissioner. A permit giving you authority to work on DPTI roads must be obtained from DPTI before any work is carried out.

This also applies to service authorities, telecommunication carriers and developers and all subcontractors where enabling legislation (e.g. Waterworks Act, Sewerage Act) provides for, or where the DPTI Regional Manager or representative approves otherwise, the quality, supply and placing of the surfacing by the excavator.
When working on or adjacent to a road under DPTI control, refer to the ‘Specification for Works on Roads by Other Organisations’.

Such notification shall include submitting a ‘Notification of Works Impacting DPTI Roads’ form (see Appendix A) with attached traffic management plans that show the location of all traffic control devices and proposed times of traffic restrictions.

Work shall be in accordance with drawings, specifications and work methods submitted to the DPTI Regional Manager or representative for approval at least four weeks prior to the commencement of the intended work.

Personnel shall advise the DPTI Regional Manager or representative of their intention to commence work at least three working days before the commencement of the works.

The Traffic Management Centre (TMC) shall be notified on 1800 018 313 by a representative of the organisation undertaking the works:

- 15 minutes prior to commencing all works; and
- immediately after the works are completed.

2.4.2 Notification of emergency works

Where either the road pavement or shoulder is damaged or excavation of road pavement and shoulder is necessary in emergency circumstances, the excavator shall provide verbal notification to the DPTI Regional Manager or a representative, as soon as practicable after the emergency becomes known. In order for an inspection and arrangements for maintenance period to commence, a ‘Notification of Works Impacting DPTI Roads’ form shall be submitted to the DPTI Regional Manager within 24 hours of the emergency occurring.

2.8 Working on roads under control of local government

Roads not controlled by DPTI that are within a local government area are under the control of the relevant local council. The legal requirements presented in this document also apply on such roads. The Local Government Workers Compensation Scheme has developed standard plans based on AS 1742.3 for use on local government roads.

For roadworks on council roads, contact the appropriate Council.
2.9 Closing roads for roadwork purposes

There are legal procedures to follow when a road needs to be closed to traffic. Check with the organisation controlling the road (DPTI or the local council) at least two weeks prior to the work. Early notice enables all emergency services to be advised before the work begins.

When an emergency arises and a road must be closed for safety purposes or to carry out emergency repairs, close the road and advise the following organisations of the action and the expected time of completion of the closure:

- Emergency services (police, ambulance and fire);
- Passenger Transport Division (for bus and train movements); and
- DPTI Traffic Management Centre on 1800 018 313.

2.9.1 Roadworks vs events on roads

On many occasions events are held on DPTI and local council roads which may require either total road closure or traffic restrictions. Ensure that roadworks do not conflict with these events.

2.10 Safe working zone at level crossings

A nominal rail corridor shall be established at all level crossings that will act as a safe working zone. The safe working zone shall extend out to 3 m from the nearest rail on each approach. Maintenance activities shall not be undertaken within the safe working zone without first notifying the rail owner and having undertaken ‘Rail Safety Awareness’ training.

The Public Transport Services Division (formerly TransAdelaide) requires notification of ten working days prior to the proposed works to allow Infrastructure Services officers to issue the relevant Train Notice and to arrange for a track protection/qualified employee.

In order to satisfy the notification requirements of the Australian Rail Track Corporation (ARTC), Genesse and Wyoming Australia (GWA), the relevant train control office shall be advised a minimum of five working days prior to the start of works, and once again immediately before the start of works, in order to gain clearance to operate at that location at a certain time so that the roadwork does not conflict with train running schedules.

All enquiries shall be directed to the train control for the relevant rail authority.

For further information on events on roads refer to: http://www.dpti.sa.gov.au/standards/tass
Section 3:
Safety and record keeping responsibilities

3.1 Maintaining a safe workplace

This document and AS 1742.3 set out the procedures for installing and operating traffic control devices to ensure that they are used consistently to provide the highest practicable level of protection to roadwork personnel and road users. The following sections address matters which shall be taken into account when working on or above roads.

3.1.1 Fire Prevention

Organisations and/or individuals undertaking roadworks or whose workplace is on a road must comply with the Fire and Emergency Services Act, 2005 (SA), if works are undertaken during the Fire Danger Season. The risk assessment plan shall include liaising with the Country Fire Service or the Metropolitan Fire Service.

3.2 Responsibility for safety at work sites

Organisations and/or individuals undertaking roadworks or whose workplace is on a road need to be aware of their responsibilities for any injury to the road user or damage to property as a result of such operations. There is an equally important obligation to provide a safe workplace environment that minimises, as far as practicable, the likelihood of injury to workers by traffic within or adjacent to the work area. Principals and contractors need to be aware of their WHS legislative requirements and implement these as they apply to this obligation.

Steps should be taken to warn the public of existing conditions and to guard, delineate and where necessary, illuminate work which may be a hazard to the road user. Care should be taken to avoid long delays or detours which may cause unnecessary inconvenience to road users.
3.2.1 Responsibilities of supervisory personnel

Supervisory personnel carrying out construction, maintenance or other works that require the use of a traffic guidance scheme should give attention to:

- being mindful of their responsibilities to provide a safe workplace for personnel and plant under their control, and safe and convenient travelling conditions for road users;
- ensuring that personnel under their control are at all times courteous to road users. Personnel should not allow themselves to become distracted by provocation from members of the public;
- ensuring that all personnel at a work site are aware of their responsibilities and that traffic controllers are appropriately trained and informed of their duties; and
- being familiar with and act, as far as practicable, in accordance with the provisions of these Standards and where applicable AS 1742.3.

3.2.2 Hierarchy of control to assess level of protection

When planning and undertaking work there is a hierarchy of control which can be used to assess whether the highest level of protection or separation from traffic is being applied. It has the following elements, in descending order of safety reliability:

- hazard elimination from the immediate location of the work area by relocating traffic via a detour of side track;
- hazard elimination by stopping traffic movement for short periods when workers occupy the roadway;
- separation of the work area from moving traffic by means of engineering controls or isolation i.e. by placing a substantially impenetrable barrier at the boundary of the work area or maintaining a level of lateral separation designed to provide adequate protection; and
- management of the risk using administrative and behavioural controls in cases where:
  - the work area is close to but not within the travelled path – by controlling the behaviour of traffic (e.g. speed of traffic) according to the lateral separation; or
  - the work area is within the traffic stream – by training in appropriate work methods and safety requirements and strictly following them.

Requirements in this Standard have been developed to meet the minimum requirements to maintain a safe work site.
3.3 Record keeping

In South Australia it is mandatory to keep records of every traffic guidance scheme used. When undertaking works on a road, the person or body responsible for the works shall keep records of the traffic guidance scheme along with any written authorisation for erecting other types of traffic control devices. These records may be required as evidence in legal proceedings and will greatly assist in establishing pre-existing work site conditions where claims for damages are made. These Standards show details for keeping records of signs and other traffic control devices used on roads. Records shall be kept on site at all times.

Records obtained by DPTI personnel shall be kept in accordance with DP009 (Record Keeping Policy).

For non-DPTI personnel, records should be kept in accordance with their own record keeping policy.

Record keeping shall begin before any signs or devices are placed. This indicates the site has been inspected and an appropriate traffic guidance scheme has been selected. On-going record keeping shall occur immediately after any changes to the placement, type or number of devices used on the job.

A satisfactory record may be provided by referring to an example diagram selected from the Field Guide or other source based on current requirements e.g. a diagram provided by an employer.

If none of the diagrams suit a particular work site then a specific traffic guidance scheme shall be drawn up for that site.

As a minimum the records shall include:

- date;
- location of the work site;
- identification of the job (permit number);
- adequate reference to a pre-prepared figure, sketch or plan of the traffic guidance scheme for the job;
- times when the scheme is in place, including the times of any changes;
- times when the installation, changes and removal of speed restriction signs occurred;
- condition of the road surface, weather conditions or other features or matter of note;
- name of person(s) responsible for setting up, changing or removing the scheme;
- name of person authorising the setting up, changing and/or removal of the scheme;

For further information refer to AS 1742.3 Appendix A.
3.4 Accident and incident records

AS 1742.3 details requirements for when there is an accident or incident at a work site (either witnessed by or reported to a worker on site). It is mandatory to report accidents to the Police when anyone is injured or the total value of damage to vehicles and equipment exceeds $3,000. It is also necessary to make a record if there is an accident or incident where legal action may arise.

The following information shall be recorded (as a minimum):

- names and addresses of those involved;
- names and addresses of any witnesses;
- actual type, size and location of signs and devices in use at the time of the accident or incident. Do not rely solely on the records made to date, instead, check and add details as necessary;
- photographs of sign and device arrangements in place at the time;
- details of the surface conditions and width of the travelled path;
- details of any hazards at the site; and
- details of prevailing weather conditions.

All of this information should relate to what was in place at the time of the accident or incident.

Make sure that any internal reporting system for accidents or incidents within your organisation are followed.

In South Australia:

- WHS rules require a report to be made to SafeWork SA when a worker is hospitalised as a result of an accident or incident at work. Report the event by phoning SafeWork SA on 1800 777 209.

Report to SafeWork SA all accidents that result in the hospitalisation of a worker.
Phone: 1800 777 209
- Motor Accident Commission (MAC) requires a report to be made when a person is injured in an accident involving a motor vehicle. Report the injury to the MAC Claims Manager at Allianz Australia Insurance Limited on 1300 137 331.

3.5 Traffic guidance schemes

Traffic guidance schemes may be in either hardcopy or electronic format. Regardless of the format chosen, they shall be made available to view at the work site.

Careful consideration should be given to the signing of the work site, no matter how brief the occupation of the site may be. This should include:

- protection of workers;
- adequate warning provision for changes in surface conditions and presence of personnel or plant engaged in works on roads; and
- adequate instruction of road users and their guidance safely through, around or past the work site.

Planning for all roadwork requires the preparation of traffic guidance schemes by a competent person. It normally takes place at one of the following levels.

3.5.1 Short-term and mobile works not involving full or part road closure

This traffic guidance scheme shall include procedures together with details of signs and devices needed to cover all of the routine tasks the workers will encounter. Procedures should be documented by means of work methods statements supported if necessary by standard plans e.g. showing the processional order and the separation distances of items in a mobile works gang.

3.5.2 Works involving relatively simple part-roadway closures

As a minimum, the traffic guidance scheme shall include:

- a sketch of the protective devices and delineation required on a plan; and
- a list of devices required for the job.

Reference to DPTI’s Field Guide or a similar standardised illustration may be used as the sketch or plan, provided it is adequate for the situation.
3.5.3 Works involving complex traffic arrangements or staged works

This traffic guidance scheme shall include a fully documented traffic management plan which provides the following:

- plans showing temporary traffic paths, their delineation and the position of traffic control or warning devices;
- a separate set of plans for each stage, if undertaking multi-stage works;
- details of after hours traffic arrangements, on separate plans if they cannot be adequately incorporated into the above;
- all necessary instructions for the installation, operation, between stage rearrangement and ultimate removal of devices at the conclusion of the job; and
- Plans must show that all existing permanent speed signing is covered up when not required.

It is essential to prepare traffic management plans before the job starts and before the start of each stage, so that there is enough time to obtain any special devices or approvals as required.

3.6 Field Guide – Traffic Control Devices for Workzone Traffic Management

DPTI has issued a supplementary guide to assist with planning works on roads entitled ‘Field Guide – Traffic Control Devices for Workzone Traffic Management’ (Field Guide). The Field Guide illustrates Section 20 of the South Australian Road Traffic Act, 1961, AS 1742.3 and these Standards.

The Field Guide can be used as a guide to prepare a traffic guidance scheme intended for use anywhere in South Australia.

However, please note that the Field Guide does not include a scenario or all situations and should be used as a guide when planning traffic guidance schemes.
Section 4: Developing traffic management plans and managing risks

4.1 Traffic management plans

Traffic management plans are prepared by following a risk based procedure considering all essential traffic management matters in an ordered way. The following matters shall be considered in turn and incorporated into the plan if relevant.

4.2 Safety and convenience

4.2.1 Safety of workers

Workers are protected from traffic by either:

- providing a road safety barrier system between the work area and moving traffic at a static work site;
- providing increased separation between the edge of the work area and the nearest traffic path or lane at a static work site;
- providing a temporary speed zone appropriate for the work area location at a static work site; and/or
- where appropriate, using the work methods for short-term low impact works and mobile works set out in this document.

4.2.2 Safety and convenience of road users

The safety of road users is increased by:

- providing traffic control and guidance at a static work site; and
- managing the work site in a way that causes the minimum amount of inconvenience to traffic movement.

Works should be arranged to minimise:

- disruption of established traffic movements and patterns;
- interference with traffic at peak movement periods;
- interference with public transport services; and
- the amount of road closed to traffic at any one time.
If the path of traffic infringes on regulatory requirements of pavement markings, use traffic control measures to direct traffic along the path or remove the conflicting regulatory pavement markings entirely. Cover or remove any regulatory signs that do not apply to the works.

4.2.3 Maintaining traffic flow

Determine the traffic flow required to accommodate an acceptable level of service and convenience to road users. This determines the amount of road space which should remain open and, where applicable, the times of day during which greater amounts of road space are needed to handle higher traffic volumes e.g. peak periods in built-up areas (see Appendix B). On two-way roads, two-way traffic flow should be maintained wherever possible. When this is not possible, travel over one lane is acceptable for short periods of time in certain conditions (see Appendix B).

4.2.4 Lane widths

Table 4.1 illustrates the minimum lane widths which shall be provided through or past work sites. Please see AS 1742.3 clause 4.13.3 for exceptions to these requirements.

<table>
<thead>
<tr>
<th>Road environment</th>
<th>Lane width</th>
</tr>
</thead>
<tbody>
<tr>
<td>60 km/h or less</td>
<td>3.0 m</td>
</tr>
<tr>
<td>Greater than 60 km/h</td>
<td>3.5 m</td>
</tr>
<tr>
<td>Two-way roadway on residential streets</td>
<td>5.5 m (total width of roadway)</td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 clause 4.13.3

4.3 Traffic management

Select the appropriate means of routing traffic through, around or past the site ensuring that all required traffic movements are provided for. Depending on the circumstances, traffic may be managed in one of the following ways:

- movement through work area under closely controlled conditions;
- movement past the work area by means of a delineated path alongside but clear of the work area;
Developing traffic management plans and managing risks

- movement around the work area by a detour, which may be via a side track or an existing road; or
- closure of the road for short periods while work is carried out.

4.3.1 Traffic through work area

Traffic is only permitted to travel through a work area if both the traffic and the work can be adequately controlled by using:

- traffic controllers or traffic signals as necessary to slow traffic on the immediate approach to an active work area, stopping traffic for short periods when required for:
  - controlling the movement of plant or other operations in the trafficable area; or
  - controlling single line shuttle working;
- a pilot vehicle to lead traffic along the desired path and to control its speed, where appropriate; and/or
- using the work methods for short-term low impact works and mobile works set out in this document, where appropriate.

4.3.2 Traffic past work area

Where the complete elimination of traffic from a site is not required, the normal method of traffic management is for traffic to travel past the work area. These paths shall be clearly delineated. At long-term works, if the original pre-works delineation (including pavement markings and raised pavement markers) are likely to misdirect drivers negotiating the site, then conflicting delineation shall be removed completely. Single shuttle line working may be required if the available trafficable roadway width is restricted.

4.3.3 Traffic around work area (side-tracks, detours and cross-overs)

When it is not practical to allow traffic through or past the work area, it may be catered for by means of either a detour using existing roads or a specially constructed side-track.

Pavement, surfaces and conditions shall be appropriate to the type and volume of traffic using the facility and its location. Temporary pavements shall have sufficient structural strength to carry the anticipated heavy vehicle traffic. Recommendations for pedestrian, cyclist, wheelchair and public transport provisions at detours are provided in AS 1742.3 clause 4.14.4. Requirements and recommendations for delineation at side-track and detours are provided in AS 1742.3 clause 4.14.6.
The following forms of **detours** should be considered:

- **Side tracks**
  
  A temporary roadway may be constructed beside or near the existing roadway, usually within the same road reserve. It may cater for one or both directions of travel.

- **Detours via existing roads**
  
  Traffic in one or both directions may be detoured via existing roads suitably located to carry traffic around the work area. Pavements shall be checked to ensure that they are structurally adequate to carry the increased volumes and loads. For detours which will be in use for periods in excess of 14 days, the lane width and design speed should match, as nearly as practicable, those of the approach road. Where a detour via existing roads is provided, signing of the detour at all changes of direction and at other locations where reassurance is needed shall be applied consistently throughout for each direction of travel.

- **Detours for heavy or over-dimensional vehicles**
  
  Heavy or over-dimensional vehicles may be detoured via existing roads suitably located and designed to carry them. This is usually required if:

  - works have temporarily reduced the height clearance or load carrying capacity of the original road; or
  - the route is designated an over-dimensional load route and works have temporarily reduced over-dimensional clearances.

- **Crossovers**
  
  Part of a divided road is converted to a two-way roadway by closing one roadway and constructing temporary crossovers to transfer traffic in that direction to the other roadway. Where traffic is required to travel temporarily in the wrong direction, the following safety measures should be considered:

  - Intersections should be checked and temporarily modified as necessary to ensure that crossing and turning movements can be made safely. Any movements that are temporarily banned should be adequately catered for elsewhere.
  
  - Potential hazards resulting from the reversal of direction such as fixed roadside objects protected in one direction only, and safety barrier and bridge parapet trailing ends which will become leading ends, should be risk assessed and remedial action taken accordingly.
  
  - Consideration of appropriate treatment options where it is necessary to cater for pedestrians crossing a temporary two-way roadway at zebra crossings, uncontrolled mid-block points or at intersections where there is traffic turning through a pedestrian control point. Signs related to these options are shown in Section 7.3 of these Standards.
4.3.4 Closures

There may be times when there is no alternative to a complete road closure. Delays to traffic should be minimised. If delays are expected to be longer than can be tolerated by traffic due to volumes, build-up of queues and expectation of road users, works methods should be altered or a detour/side track provided.

4.4 Traffic control

Except for some exemptions for short-term and low-impact works as outlined in AS 1742.3, traffic shall only be permitted through a work area where both traffic and the work can be adequately controlled. Traffic controllers and temporary traffic signals shall be employed as necessary to stop and/or direct traffic at roadwork sites. In limited circumstances a temporary ‘Give Way’ and ‘One Lane’ sign assembly may be used instead of traffic controllers.

Determine the need for traffic control by traffic controllers, temporary traffic signals (portable or fixed), police or other means.

4.4.1 Where to use traffic controllers

- Bitumen surfacing works under traffic.
- Single lane operation e.g. a lane closure on a two lane, two-way road or bridge.
- Where there is limited sight distance within a work site.
- Where construction traffic is crossing or entering a roadway.
- Temporary total road closures e.g. blasting works.
- Emergency situations.

4.4.2 Where to use a single traffic controller

Traffic control may be performed by a single traffic controller for short-term partial road closures on unsealed roads under the following conditions:

- the single lane section does not exceed 50 m in length;
- the volume of passing traffic is not more than 20 vph; or
- the traffic controller has a good view of traffic approaching from both directions when stationed at one end of the job.

For further information refer to the following AS 1742.3 clauses:
- 2.3.3
- 3.5.2
- 3.5.3
- 3.5.4
- 4.10
- 4.11
4.4.3 Where to use temporary traffic signals

- For single lane operation i.e. a lane closure on a two lane, two-way road or bridge.
- Construction traffic is crossing or entering a roadway.
- Limited sight distance within a work site.

Portable traffic signals are intended for traffic control applications of a relatively short duration only. For longer periods consider using temporary fixed traffic signals. Temporary signals will require a power supply for continuous use.

See Appendix B to determine the desirable maximum length of single lane operation under reversible flow.

4.4.4 When to use a temporary ‘Give Way’, ‘One Lane’ sign assembly

When all of the following conditions apply:

- the work area is less than 100m in length;
- each entry to the work area is visible from the other;
- a sight distance to opposing traffic of at least 200 m beyond the far end of the work area for the traffic facing the ‘Give Way’ sign;
- the traffic volume is 150 vpd or less; and
- the traffic speed is 70 km/h or less.

4.5 Other road users

Determine the need to provide for road users other than vehicle traffic including:

- pedestrians (including people with disabilities);
- bicycles;
- school children; and
- emergency vehicles.

4.5.1 Pedestrians and cyclists

Where pedestrians (including people with disabilities or visual impairment) have to move through, past or around a work site or to cross the road within a work site, they shall be provided with and directed to either of the following:

- temporary or alternative footpaths and crossing points;
- formal pedestrian crossings; or
refuges (if warranted).

Pedestrians, including those with mobility and visual impairment require special consideration. Those in wheelchairs require smooth, direct and continuous access while those with vision impairment require an easy-to-navigate alternative.

When appropriate, bicycle lanes should continue as temporary lanes through a work zone. Where this is not possible, consider providing off-road temporary bicycle paths. It may be possible to safely integrate cyclists and motor vehicles where a work zone is governed by reduced traffic speed.

Pedestrian and cyclists paths should be provided on the same scale and to the same width as the facilities that existed prior to the works.

4.6 Special vehicle requirements

Determine the need to provide for vehicles such as:

- buses and trams, including stops and terminals;
- over-dimensional vehicles; and
- restricted vehicles.

4.6.1 Vehicle size and load restrictions

Where the width, height or load carrying capacity of the roadway or structure is to be temporarily reduced during works, the appropriate authority should be informed in advance of the works. They should also be advised once the restriction is removed.

4.7 Night works

If applicable, determine if any special requirements for over night traffic operations are required.

4.8 Advance notice of works

Depending on the complexity of the traffic management plan and the length of time it is expected to operate, it may be necessary to erect special signs to
inform the public of the works. It may also be advisable to implement a publicity campaign using printed material and local media, particularly the radio.

In addition, when applying for a roadworks permit from the DPTI Regional Offices, the location of the works will be printed in ‘The Advertiser’ newspaper Daily Roadworks Report and made available online at www.dpti.sa.gov.au.

Portable variable message signs (VMS) are used to give advance notice of works to road users. VMS should only be used to supplement existing roadside infrastructure and should not be used as a substitute for conventional signs and pavement markings.

Roadwork messages on portable VMS must be approved by the DPTI Regional Manager or Council or their respective representative.

### 4.9 Risk management

Risk management involves the identification and analysis of all hazards likely to arise during works on roads including the set up, operation, change and removal of a traffic guidance scheme, followed by the determination of appropriate measures to mitigate those risks. This process is appropriate at all levels of planning and operation when preparing traffic guidance schemes for:

- minor routine and mobile works (i.e. procedures, work method statements and standardised plans);
- works involving relatively simple part-roadway closures (i.e. sketches, plans and references to the Field Guide or similar standardised illustrations); and
- works involving complex traffic arrangements or staged works (i.e. traffic management plans).

This Standard and AS 1742.3 provide guidance and the minimum requirements for works. Variations below these requirements shall only be made on the basis of a documented risk assessment prepared by a competent person in consultation with affected parties. Where superior hazard controls are identified through this process they should be adopted in preference to minimum requirements.

**4.9.1 Risk assessment**

A risk assessment should be carried out that:

- identifies all the hazards likely to arise;
- results in the development of a traffic guidance scheme or procedural statement that controls or reduces any significant risks;
- checks the proposed traffic guidance scheme or procedural statement in detail to ensure that the means of controlling or reducing any significant risks are adequate; and
- uses historical data, experience or other means, to evaluate the hazards in terms of:
  - likelihood of occurrence; and
  - adverse consequences.

Assessments should consider the following for workers and other road users:
- details of work to be undertaken e.g. duration and location on road;
- traffic volumes and traffic speeds through the work site;
- road geometry including road and carriageway widths;
- sight distances; and
- history of WHS accident/incident records relating to these types of activities, the work location and work units.

The risk assessment should be reviewed on site. The following points should be checked to ensure that risks are reduced:
- ensure all workers are briefed on safety requirements;
- ensure all workers wear high visibility clothing;
- minimise obstructions to traffic, pedestrians and other road users;
- allow safe access to neighbouring properties and side streets;
- erect the correct speed signs to suit the work site;
- ensure all signs and devices are correct and clear to road users;
- ensure all existing permanent signs are covered up;
- check for glare and other distractions to road users; and
- regularly review the traffic guidance scheme during installation and operation as the risks may have changed.

In Fire Danger Season the risk assessment shall include liaising with Country Fire Service and/or Metropolitan Fire Service.

*Risk assessments shall only be conducted by an ‘accredited officer’.*

### 4.9.2 End of day risk assessment

In addition to the information above, an end of day risk assessment shall be carried out at the end of the day when a worksite is to be left unattended over night. This assessment shall be documented and signed off by an accredited officer.
**NOTE:** an unattended work site shall be setup for the *road user* and not for the road worker.

Ensure that the speed limits used are correct for the conditions. If a reduced speed limit is used e.g. 25 km/h, then all reasons why it is used shall be documented and shall always be available on request. Refer to the record keeping requirements included in this Standard (section 3.3) for further information.

All symbolic worker signs shall be removed or covered over when not required.

If applicable, the return to speed limit signs shall correctly placed.
Section 5:
Devices used at typical work sites

5.1 Functions of signs and devices

The functions of the various traffic control devices are to:

- warn, guide and instruct drivers, pedestrians or other road users;
- draw attention to the work area, personnel and equipment;
- control speed or traffic within and adjacent to work area;
- indicate the direction and width of the available travelled path;
- discourage access to the whole of, or a portion of, the work area; and
- provide physical protection for the work area and its occupants.

5.2 Format of signs

The format of signs used at works on roads is shown in Table 5.1.

<table>
<thead>
<tr>
<th>Sign type</th>
<th>Sign format</th>
<th>Sign example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signs warning of workers on foot</td>
<td>Rectangular with a black legend on retroreflective fluorescent orange background</td>
<td>![Workers (symbolic) <a href="#">T1–5</a>]</td>
</tr>
<tr>
<td>PREPARE TO STOP signs and signs associated with blasting operations</td>
<td>White legend on red background, both retroreflective</td>
<td>![Prepare to Stop <a href="#">T1-18</a>]</td>
</tr>
<tr>
<td>Direction and other roadwork signs</td>
<td>Rectangular with a black legend on retroreflective yellow background</td>
<td><img src="#" alt="Detour [T5-1(L)]" /></td>
</tr>
<tr>
<td>Regulatory, warning and traffic instruction signs used for roadworks (i.e. R, W and G Series signs)</td>
<td>Same as permanent counterpart – substrates and sign mountings may need to be altered</td>
<td><img src="#" alt="40" /></td>
</tr>
</tbody>
</table>
5.2.1 Retroreflective material

Retroreflective material used on signs for work on roads shall as a minimum meet the requirements for Class 1 material as specified in AS/NZS 1906.1.

5.2.2 Size of signs in the ‘T’ series

There are two sizes of signs that are usually used for works on roads. The application of the sign sizes A and B are as follows.

- **A size** is applicable to all signs in the T Series and suitable for:
  - traffic speeds up to 90 km/h (with a lateral offset between the sign and travel path of no more than 8 m);
  - traffic speeds up to 110 km/h (with a lateral offset between the sign and travel path of no more than 4.5 m);
  - signs directed at pedestrians;
  - Stop/Slow Bats used by controllers; and
  - repeater speed signs (R4-1).

- **B size** applies where an oversize sign may be required:
  - where recommendations for the A size sign are exceeded;
  - on expressway and freeway type roads for added emphasis of the onset of works, detours or closures;
  - for other critical safety messages; and
  - where traffic speeds exceed 70 km/h and the A size signboard is less than 1 m² in area.

**Note:** The use of C size signs to enhance a situation and may be used.

5.3 Signs that may be used in South Australia

Only signs defined in AS 1742.3 or included on the DPTI Standard Sign List shall be used when working on the road.

In special circumstances, signs that do not appear in the above documents may be used with the approval of DPTI. Special signs must be designed in accordance with the requirements of AS 1742.3, for example, a sign advising of future roadworks would need to:

- be rectangular;
Devices used at typical work sites

- have a yellow retroreflective background and a black border;
- have a black legend; and/or
- letters of such a size that they can be read by drivers at the prevailing traffic speed.

All Australian Standard signs have a unique alpha-numeric identification code to assist in placing orders for signs.

5.3.1 DPTI standard sign list

The DPTI Standard Sign Index defines signs available for use in South Australia. These signs have been designed by DPTI's Traffic and Access Standard Section. Signs with “SA” in the alpha-numeric code are for use in South Australia only e.g. T1-SA2.

5.4 Multiple sign displays

In cases where AS 1742.3 requires two signs to be displayed together at the one position e.g. Workers (symbolic) and Speed Restriction signs, they may be displayed on the same mounting side by side. Sign sizes may be reduced if the legend size, symbol size and area occupied by the legend are unchanged.

Multi-message signs that combine up to three signs in one frame may also be used in South Australia subject to the requirements of DPTI Operational Instruction 3.13.

5.5 Components of a work site

The components of a typical work site are:

- Advance warning area;
- Taper area;
- Safety buffer;
- Work area; and
- Termination area.

These components are illustrated in Figure 5.1.
5.5.1 Dimension D

Dimension $D$ is a distance expressed in metres, used for the positioning of advance signs and related purposes.

For the purpose of calculating $D$, the speed of traffic shall be taken as either:

- the speed of traffic in the speed zone immediately preceding the zone in which the advance sign occurs, see figure 4.2 (a) in AS 1742.3; or
- the speed of traffic at the advance sign if there has been no zone change for the preceding 200 m or greater, see figure 4.2 (b) in AS 1742.3.

The value of $D$ shall be determined as shown in Table 5.2.

<table>
<thead>
<tr>
<th>Speed of traffic (km/h)</th>
<th>Dimension D (m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>45 or less</td>
<td>0-5</td>
</tr>
<tr>
<td>46-55</td>
<td>15</td>
</tr>
<tr>
<td>56-65</td>
<td>45</td>
</tr>
<tr>
<td>Greater than 65</td>
<td>Equal to speed of traffic, in km/h</td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 table 4.2

5.6 Advance warning area

Advance warning signs and devices are used within the advance warning area. Place these signs and devices so that they allow adequate time for the correct response from drivers under the worst anticipated conditions. These signs shall be displayed as prominently as possible taking into account the best sight distance for approaching traffic. Provide them on all approaches to the work area.
area, including any side roads. Flashing lamps may be used to draw attention to advance signs.

Advance warning signs shall be placed on both sides of the roadway in advance of the beginning of the taper. Signs should be placed:

- 2 $D$ back from the first sign;
- $D$ back from the first sign for approach speeds less than 65 km/h; or
- 100 m back from the first sign if a buffer zone is installed.

Advance warning signs for long-term works exceeding a continuous two week period should be erected in a permanent manner e.g. on posts sunk into the ground.

5.6.1 Advance warning signs

Signs that are placed in advance of work areas are shown in Table 5.3.

Table 5.3: Advance warning signs

</tbody>
</table>
Devices used at typical work sites

**Roadwork X km Ahead [T1-16]**
Should be used X km in advance of arterial road sites if extra advance warning is needed (traffic speed over 80 km/h and sight distance less than 150 m).

**Bridgework Ahead [T1-2]**
Shall be used at long-term bridgeworks involving a closure, part closure or diversion of traffic.

**Road Plant Ahead [T1-3-1] or [T1-3-2]**
Shall be used at work sites where machinery is working on the roadway and no form of traffic control, barrier or delineation is present.

**Grader Ahead [T1-4]**
May be used instead of Road Plant Ahead where a grader alone is engaged in pavement, shoulder or roadside maintenance.

Reference: AS 1742.3 clause 3.4

### 5.6.2 Intermediate advance warning signs

Intermediate advance warning signs shall be used where additional warning is needed to advise of an action that may be required, or road conditions. These signs should be erected at least $D$ metres before the start of the hazard or greater distance if warranted. If hazardous conditions extend over considerable lengths signs may need to be repeated at regular intervals of up to 500 m. Road condition signs outside an active work area may not require additional advance warning provided the normal running lanes are not obstructed.

Road condition signs are shown in Table 5.4. Other intermediate advance warning signs that are often used include:

- Prepare to Stop [T1-18]; and
- Signals Ahead [T1-30].

#### Table 5.4: Road Condition Signs

**Slippery [T3-3]**
Should be used to warn of conditions which render roadway surfaces or edges temporarily hazardous. May be used to warn of water or ice. May be used
with Loose Surface to warn of loose material.

**SOFT EDGES [T3-6]**

Should be used to warn of conditions which make roadway surfaces or edges temporarily hazardous.

**ROUGH SURFACE [T3-7]**

Should be used to warn of conditions which make roadway surfaces or edges temporarily hazardous.

**Loose Stones [T3-9]**

Shall be used if flying stones may be a hazard. May be used to: protect surfaces against aggregate loss; warn stones may fly at fresh bituminous surfacing.

**GRAVEL ROAD [T3-13]**

Should be used to warn of conditions which make roadway surfaces or edges temporarily hazardous.

**LOOSE SURFACE [T3-14]**

Should be used to warn of conditions which make roadway surfaces or edges temporarily hazardous.

Reference: AS 1742.3 clause 3.7

### 5.6.3 Advance warning distances

**Table 5.5:**

**Advance warning sign distances**

<table>
<thead>
<tr>
<th>Number of advance sign positions</th>
<th>Approach speed km/h</th>
<th>Distance m</th>
</tr>
</thead>
<tbody>
<tr>
<td>One</td>
<td>less than 65 km/h</td>
<td>$D$</td>
</tr>
<tr>
<td>One</td>
<td>65 km/h or more</td>
<td>$2D$</td>
</tr>
<tr>
<td>more than one</td>
<td>all approach speeds</td>
<td>$D$</td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 clause 4.7.2

### 5.6.4 Advance warning sign exceptions

Special cases that are exceptions to the normal use of advance warning signs are provided in Table 5.6 below.
Table 5.6
Exceptions to advance warning sign usages

<table>
<thead>
<tr>
<th>Long distance signs</th>
<th>For further information refer to: AS 1742.3 clause 4.7.2.</th>
</tr>
</thead>
<tbody>
<tr>
<td>On freeways and other roads where traffic speed is 90 km/h or greater, additional Roadwork X km Ahead [T1-6] type signs may be required.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Frequently changing work areas</th>
<th>For further information refer to: AS 1742.3 clause 4.3.4.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under appropriate conditions advance signs may be displayed up to 2 km in advance of the work vehicle.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mobile works</th>
<th>For further information refer to: AS 1742.3 clause 4.6.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advance signs for mobile works activities are carried on vehicles.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Temporary traffic signals</th>
<th>For further information refer to: AS 1742.3 clauses 3.7.2 and 3.11.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long distance warning of unexpected temporary traffic signals may be required e.g. open road areas.</td>
<td></td>
</tr>
</tbody>
</table>

The sign assembly Signals Ahead [W3-3] and 1 km [W8-5] should be used in this case.

Reference: AS 1742.3 clause 4.7.1

5.6.5 Avoiding end of queue collisions

Under heavy traffic conditions long queues may form at a work site. Depending on the speed of traffic and sight distance to the end of the queue, additional advance warning may be required to avoid end of queue collisions. End of queue protection shall be provided whenever a stationary queue is likely to extend to a point more than \( D \) beyond the ‘Prepare to Stop’ sign.

If queuing is likely then evenly spaced ‘Prepare To Stop’ repeater signs are required as in figure 5.2.

For further information refer to: AS 1742.3 clause 4.7.8.
5.7 Taper area

If a roadway has to be partially closed, an appropriate taper should be formed by setting temporary bollards or traffic cones so that they direct traffic past the work area. Wherever possible, the full length of the taper should be visible to approaching traffic.

The travelled path on the approaches and past the work area shall be delineated so as to properly define which part of the roadway is available to road users, or the path that the traffic is required to follow.

Consideration should be given to delineation in all reasonably expected weather and atmospheric conditions, day or night.

Refer to the Field Guide for typical taper applications.
5.7.1 Lane closures using tapers

The following types of tapers are used:

- traffic control at the beginning of a taper where there is a traffic controller or temporary traffic signals just prior to a single lane;
- lateral shift taper where traffic is required to shift laterally without conflict with another traffic stream; and
- merge taper where one lane of traffic is required to merge into another.

When closing more than one lane on multi-lane roadways, one lane should be merged at a time, with the distance between the end of the first merge and the start of the second taper being at least $1.5D$.

Lane Status signs shall be used where one or more lanes of a multi-lane roadway are closed. These signs indicate the lanes that are closed to traffic by ‘bars’ whilst arrows indicate the lanes that are available to traffic.

Different versions of Lane Status signs that show more than three lanes may be used. In addition, Lane Status signs made with removable and reversible symbols may also be used as this type of sign has a number of different options that can be selected to suit the particular lane closure that is currently in operation.

For lane closures which require complex driving manoeuvres, the production of special signs incorporating curved arrows which better depict the travelled path alignment should be considered.

<table>
<thead>
<tr>
<th>Table 5.7: Signs and devices for lane closures</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lane Status [T2-6-1] or [T2-6-2]</strong></td>
</tr>
<tr>
<td>Shall be used where one or more lanes of a multi-lane roadway are closed. Shall only be used to give advance warning of lane closures and not in lieu of adequate signing and delineation of the closure. This sign shall be placed on both sides of the road.</td>
</tr>
</tbody>
</table>

| **Barrier board** |
| A type of barricade used to inhibit access to a work area. Shall not be used for delineation. Shall not be placed parallel to the direction of traffic flow as they can become a spearing hazard if struck end on by an out of control vehicle. |

Reference: AS 1742.3 clause 3.8.

For further information regarding tapers including recommended lengths of tapers refer to AS 1742.3 clause 4.8.
5.7.2 Devices for delineating and indicating the travelled path

Devices used to form tapers may comprise of one or more of the following:

- traffic cones;
- temporary bollards;
- temporary hazard markers (T5-4);
- roadworks delineators; and/or
- vehicle or trailer-mounted illuminated flashing arrow signs.

Traffic cones or temporary bollards may be used to form a taper for a short-term day time work site.

Devices used to form tapers should be spaced so that traffic is discouraged from weaving through them.

For periods of a longer duration, it is recommended substituting roadworks delineators to form the taper. They should be spaced so that they appear as a continuous line to an approaching driver.

Temporary line marking may be used to define the delineated pathway more clearly. Raised pavement markers may be used in conjunction with line marking.

Devices for delineating and indicating the travelled path are shown in Table 5.8.

Table 5.8: Devices for delineating and indicating the travelled path

<table>
<thead>
<tr>
<th>Devices Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic cones – small (450 to 500 mm)</td>
<td>Used in most built-up areas and open road applications including footpaths, shared paths and bicycle paths where traffic speeds do not exceed 70 km/h.</td>
</tr>
<tr>
<td>Traffic cones – standard size (minimum 700 mm)</td>
<td>Used in all other road applications where traffic speeds exceed 70 km/h. May also be used on lower speed roads.</td>
</tr>
<tr>
<td>Temporary bollards (minimum 750 mm)</td>
<td>A vertical parallel sided or tapered tube of fluorescent orange or red material that is resilient to impact.</td>
</tr>
</tbody>
</table>

For further information refer to AS 1742.3 clause 3.9.1 and AS/NZS 1906.1.
5.7.3 Traffic cones and temporary bollards

Traffic cones and temporary bollards may be displaced by passing traffic. Unless workers are present to replace them they should not be used unless they are securely fixed to the pavement or weighted to provide adequate stability from passing traffic when unattended.

For night time use, traffic cones and temporary bollards shall be fitted with a white horizontal retro reflective band.

Table 5.9 gives the recommended maximum spacing of traffic cones and temporary bollards.

<table>
<thead>
<tr>
<th>Purpose and usage</th>

</tr>
<tr>
<td>Lateral shift tapers (see AS 1742.3 clause 4.8.2)</td>
<td>51 to 70</td>
<td>12</td>
</tr>
<tr>
<td>(see AS 1742.3 clause 4.8.2)</td>
<td>&gt;70</td>
<td>18</td>
</tr>
<tr>
<td>Protecting freshly painted lines</td>
<td>51 to 70</td>
<td>24</td>
</tr>
<tr>
<td></td>
<td>&gt;70</td>
<td>60†</td>
</tr>
</tbody>
</table>

* This spacing may be extended to 60 m where the length of the line of traffic cones or temporary bollards exceeds 1 km but not adjacent to locations where there are workers on foot.

† This spacing may need to be reduced on curves or crests or if the row of traffic cones is not clearly defined at night.

Reference: AS 1742.3 table 3.7 and clause 3.9

#### 5.7.4 Roadworks delineators

Roadwork delineators that are used at or near works on roads shall meet the requirements of AS 1742.3 and AS/NZS 1906.2.

They should be used for delineation as follows:

- for delineation of the travel path through or past the work site as an alternative to traffic cones or temporary bollards – yellow delineators on both sides of the roadway; and
- for delineation of the roadway on detours and side-tracks – red delineators on the left side and white on the right side (two way roadway) or yellow on the right side (one way roadway).

They should be erected 1 m minimum from the edge of the travelled path and at a uniform height of approximately 1 m above the road surface. Delineator posts should be frangible or otherwise non-hazardous. Delineators should be installed so as to provide a single continuous line defining the travelled path.

The spacing of delineators shall be as follows:

- 24 m maximum at traffic speed up to 70 km/h; and
- 60 m maximum at higher traffic speeds.
5.7.5 Temporary hazard markers

Temporary hazard markers should be used to show any lateral change of direction of the travelled path through a work site and to delineate hazards and non-trafficable work areas adjacent to the travelled path. They should be erected allowing a clearance of about 1 m from the edge of the travelled path. Chevrons should always point to the side which the traffic is required to pass.

The T5-5 sign should be used on short-term day time work sites to indicate the start of a line of traffic cones or temporary bollards where the devices themselves may not be sufficiently visible to approaching traffic.

5.7.6 Pavement markings, pavement markers and temporary kerbing

Pavement markings should be provided on roads where pavement markings existed prior to works.

Raised retroreflective pavement markers may be used in conjunction with temporary pavement markings at long-term sites.

Temporary kerbing may be used to form temporary medians, traffic islands or pavement edges at long-term works.

5.8 Safety buffer

An area immediately ahead of a work area shall be provided as a safety buffer wherever the speed of traffic is 60 km/h or more. An area 20 to 30 metres in length is normally sufficient. However, the area must be adequately seen by approaching traffic. A safety buffer shall be kept free of plant, materials and work activity. It may be used for vehicular access. When using devices such as a vehicle mounted illuminated flashing arrow sign, they should be mounted and displayed at the beginning of the area.

5.9 Work area

The work area is the part of the road where works are physically being carried out and workers may be working.

5.9.1 Work area edge clearances

When measuring distances for the purpose of determining an appropriate treatment for a static work site, measure from the edge of the traffic lane to devices using the edge that are closest to the traffic.
5.10 Termination area

Signs placed at the end of the termination area indicate the end of works and that normal traffic conditions and/or speed limits resume. Termination signs shall be placed a distance of $D$ further away from the last point on the roadway or verge affected by the works.

Table 5.10 shows the termination sign options.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 clause 4.1.4.
Section 6: Using regulatory signs and devices

6.1 Regulatory traffic control devices

Regulatory signs are signs that must be obeyed by law. They are used to indicate and reinforce traffic regulations, rules and restrictions. Some examples of these include speed limit, give way and stop signs. The following signs are often used at work sites to regulate road users or compliment regulatory signs.

6.2 Roadwork speed limits

Section 20 of the ‘South Australia Road Traffic Act, 1961’ prescribes the maximum speed at works on roads for work sites, work areas and hazardous work areas.

A temporary speed zone established at works on roads shall only apply while the relevant conditions exist. It shall be removed as soon as practicable after the need for its imposition passes.

Speed zones for traffic safety purposes should not be used where alternative means of traffic control would be adequate, nor should they be used to avoid the necessity for some other more appropriate action, such as the use of a traffic controller.

The maximum speed limits shall be used for the following parts in a workzone:

- Work site – 80 km/h;
- Work area – 40 km/h; and
- Hazardous work area – 25 km/h.

Where there is no work area or hazardous work area and the normal speed limit for the road is 80 km/h, a roadwork speed limit of 60 km/h may be used under the following conditions where:

- plant only is operating;
- the road surface has been degraded;
- a fresh bituminous seal has just been laid; and/or
- traffic is subject to:
  - a reduced standard alignment e.g. an uneven road surface due to roadworks; and
  - a permanent speed limit over 60 km/h.
6.2.1 Start of speed zone

Roadwork speed restriction signs shall not be used alone but in addition to other signs and devices required at the work site. Speed restriction signs shall be placed on both sides of the roadway at the start of the speed zone, unless the normal speed limit is 40 km/h, in which case a speed restriction sign is required on the left-hand side only.

6.2.2 Buffer zone speed limits

Advance warning of a temporary speed zone shall be provided by means of a buffer zone, comprising a speed zone of intermediate value according to the following table. The purpose of a buffer zone speed limit is to reduce vehicular speeds before the work area or hazardous work area speed zone commences or where plant is operating. The buffer zone speed limits are 80 and 60 km/h.

A speed reduction of no greater than 59 km/h (e.g. a reduction from 110 km/h to 60 km/h) shall have a buffer speed zone of 300+/−50 m long. A reduction in speed of 60 km/h or more may be phased in through two steps for safety or other reasons. Note that the length of a speed buffer zone (BZ) is determined by the proceeding speed.

Table 6.1: Buffer zone speeds

<table>
<thead>
<tr>
<th>Proceeding speed limit (km/h)</th>
<th>Work area speed limit (km/h)</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>25</td>
<td>40</td>
</tr>
<tr>
<td>70 or less</td>
<td>n/a</td>
<td>n/a</td>
</tr>
<tr>
<td>80 or 90</td>
<td>60</td>
<td>n/a</td>
</tr>
<tr>
<td>100 or 110</td>
<td>60</td>
<td>80</td>
</tr>
</tbody>
</table>

Reference: Based on AS 1742.3 Table 4.7

A buffer zone speed limit is not required for traffic leaving a lower speed zone.

6.2.3 Return to speed signs

The Speed Restriction sign [R4-1] is used to display the appropriate speed limit on sealed roads as soon as possible at the end of the work site. The sign shall display the appropriate speed for the road following the roadwork.

Signs shall be placed on both sides of the road.
On unsealed roads the End Speed Limit sign [R4-12] must be displayed at the start point of a section of road covered by the rural speed limit.

6.2.4 Length of work area

To encourage drivers to obey the signs the speed limit zone should not be greater than the length of the work area which should be kept as short as possible. Workers should, wherever possible, avoid setting up or working in an area defined as a hazardous work area.

<table>
<thead>
<tr>
<th>Work Area Lengths (m)</th>
<th>Max Speed Limit (km/h)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 – 200 *</td>
<td>25</td>
</tr>
<tr>
<td>500 *</td>
<td>40</td>
</tr>
<tr>
<td>150 min</td>
<td>60</td>
</tr>
<tr>
<td>500 min</td>
<td>80</td>
</tr>
</tbody>
</table>

* Note: for traffic management purposes, if a longer length work area is required, it should be highlighted in the submission for approval to the Road Authority.

6.2.5 Repeater signs

If the roadwork speed zone is longer than 500 m, the repeater signs shall be installed on the left-hand side of the road at appropriate intervals not exceeding 500 m. The Repeater Speed Restriction sign [R4-1A] (450 mm x 600 mm) is reserved for this purpose.

Repeater signs shall be installed where it may appear that a temporary roadwork speed limit no longer applies or when traffic enters from side streets and it is necessary to advise of the speed limit.

6.2.6 Offset speed zones

Temporary speed zoning which results in speed limits which are different from each direction of travel at a particular location shall be permitted as follows:

- on a divided road where works affect traffic on one side of the median only; and
- on a divided or undivided road where a buffer zone has been installed.
6.3 Traffic controller

6.3.1 Manual traffic control

Signs and devices that are used for manual traffic control are shown in Table 6.3. The ‘Stop’ face of the ‘Stop/Slow Bat’ is a regulatory sign.

Table 6.3:
Signs and devices for manual traffic control

STOP/ SLOW Bat [R6-8, T7-1]
Shall be used by a traffic controller to control traffic at any temporary obstruction or hazard.

Refer to Appendix C of AS 1742.3 for the model instructions for the establishment of manual traffic control and for the training of a traffic controller.

An alternative to the use of a ‘Stop/Slow Bat’ is to use a ‘Stop’ sign mounted on a boom barrier that is operated by a traffic controller (also known as a book barrier).

Other alternatives to the manual control of a ‘Stop/Slow Bat’ such as remote operation may also be used to control traffic at a temporary obstruction or hazard. This is provided that a traffic controller is seen to be in control of the remote operation of the ‘Stop/Slow Bat’ from the perspective of a road user, and that the correct sign faces are used.

Prepare to stop [T1-18]
Shall be used with the Traffic Controller (symbolic) sign to give advance warning where traffic may be required to stop in compliance with the directions of a traffic controller.

Traffic Controller (symbolic) [T1-34]
Shall be used to give advance warning of the presence of a traffic controller. Shall be used with ‘Prepare to Stop’ sign if traffic may be required to stop at traffic controller position.

Portable two-way radios
Portable two-way radios or similar means shall be used for communication between traffic controllers (except near blasting works) if unable to communicate by sight.

Reference: AS 1742.3 clause 3.5.2
6.3.2 Sign control, single lane operation

The ‘Give Way’, ‘One Lane’ sign assembly is to control traffic by signs only. It is appropriate for road and bridgeworks when:

- traffic volume is 150 vpd or less and speed is 70 km/h or less;
- each work area entry is visible from the other;
- the work area is less than 100 m in length; and
- sight distance to opposing traffic is at least 200 m beyond the far end of the work area for traffic facing the ‘Give Way’, ‘One Lane’ signs.

Traffic may be controlled by signs only using the devices shown in Table 6.4. The ‘Give Way’ and ‘No Overtaking or Passing’ signs are both regulatory signs.

Table 6.4:
Signs for sign control, single lane operation

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 clause 3.5.3.
6.4 Traffic signal control

Signs and devices that are used to control traffic by traffic signals are shown in Table 6.5. ‘Stop Here on Red Signal’ is a regulatory sign.

### Table 6.5: Signals and signs to control traffic

<table>
<thead>
<tr>
<th>Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>STOP HERE ON RED SIGNAL [R6-6]</strong></td>
<td>Shall be used to indicate where traffic must stop when there is no stop line on the pavement. It is recommended to supplement the stop line where one is provided.</td>
</tr>
<tr>
<td><strong>Portable traffic signal</strong></td>
<td>Usually consists of two signal heads each comprising a three-aspect signal face (red, yellow and green), two vehicle detectors, a signal control unit and power source.</td>
</tr>
<tr>
<td><strong>Prepare to stop [T1-18]</strong></td>
<td>Shall be used with the ‘Signals Ahead’ sign to give advance warning if portable or temporary fixed traffic signals are used to control traffic.</td>
</tr>
<tr>
<td><strong>Signals Ahead [T1-30] &amp; [W3-3]</strong></td>
<td>If portable or temporary fixed traffic signals are used to control traffic, the ‘Signals Ahead’ sign shall be used to give advance warning along with the ‘Prepare to Stop’ sign.</td>
</tr>
</tbody>
</table>

For long-term use with temporary fixed signals the diamond version of this sign [W3-3] may be substituted.

Reference: AS 1742.3 clause 3.5.4.
6.5 Road closures

Signs and devices that are used at road closures are shown in Table 6.6. ‘No Entry’, ‘No Right Turn’ and ‘No Left Turn’ are regulatory signs.

Table 6.6: Signs and devices for road closures

<table>
<thead>
<tr>
<th>Sign/Device Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO ENTRY [R2-4]</td>
<td>Should be used to compliment the ‘Road Closed’ sign so that the road closure is enforceable.</td>
</tr>
<tr>
<td>No Right Turn [R2-6(R)]</td>
<td>Should be used to compliment the ‘Road Closed’ sign so that the road closure is enforceable.</td>
</tr>
<tr>
<td>No Left Turn [R2-6(L)]</td>
<td>Should be used to compliment the ‘Road Closed’ sign so that the road closure is enforceable.</td>
</tr>
<tr>
<td>ROAD CLOSED [T2-4]</td>
<td>Shall be used where a roadway is closed to traffic in conjunction with barrier boards completely barring access to the roadway. Consideration should be given to traffic detours. The ‘Road Closed’ sign by itself is only a warning sign and is not enforceable.</td>
</tr>
</tbody>
</table>

Barrier boards

Should be mounted on trestles of fixed posts 1 m above the pavement. These shall not be placed parallel to direction of traffic flow as it may become a spearing hazard if struck end on by an out of control vehicle.

Reference: AS 1742.3 clause 3.8.

6.6 Detour signs

Signing arrangements at detours should be checked to ensure that all detour signs are prominently displayed. Detour and side-track pavements shall be monitored to ensure any indications of impending pavement failure are dealt with promptly.
Signs used for detours are shown in Table 6.7 below.

<table>
<thead>
<tr>
<th><strong>Table 6.7: Detour signs</strong></th>

</tr>
<tr>
<td><img src="image" alt="Detour marker" /></td>
</tr>
</tbody>
</table>

Reference: AS 1742.3 clause 3.6.
Section 7: Additional signs and devices

7.1 Signs and devices on vehicles

Warning devices such as rotating flashing lamps, illuminated flashing arrow signs or variable message signs (VMS) may be used to warn road users.

7.1.1 Vehicle-mounted warning device

A vehicle-mounted warning device shall comprise of one of the following:

- a single rotating flashing yellow lamp for emergency or other infrequent use on a vehicle not normally used for roadwork purposes. Also for use on a plant item working within a static work area or an inspection vehicle operating in accordance with AS 1742.3 clause 4.3.6 (a) (ii) or (b);
- a pair of rotating flashing yellow lamps for use on vehicles working on roads with a traffic volume up to 1500 vpd and positioned on the vehicle so that at least one lamp is visible from any direction; or
- an illuminated flashing arrow sign (see below for details) for any work including that described in the previous two dot-points, and for mobile works where indicated in AS 1742.3 clause 4.6.

The vehicle-mounted warning device shall be mounted as high as practicable on the vehicle for best visibility to traffic e.g. on the roof of the truck. Supplementary signs such as ‘Line Marking’ may be mounted in conjunction with the illuminated flashing arrow or elsewhere in a prominent position on the body of the vehicle.

If signs are mounted on a device or elsewhere on a vehicle they shall be capable of being removed from view if not required (i.e. able to cover, fold, turn off).

For additional information refer to AS 1742.3 clauses 3.12.1 and 3.12.3.

7.1.2 Illuminated flashing arrow sign

This sign comprises a matrix of lamps or light emitting elements in the form of an arrow that is flashed in a cyclic manner to provide advance warning of a temporary diversion. It includes a backing board for the lamps or light-emitting devices together with additional equipment for mounting and operating the sign.

Flashing arrow boards shall be used where the traffic volume is greater than 1500 vpd.

For additional information refer to AS/NZS 4192.
Rotating flashing lamps may be used in conjunction with this sign, provided the lamps are either appropriately shielded or laterally or vertically displaced from the edge of the sign to avoid corrupting the arrow shape or its directional effect.

### 7.1.3 Supplementary vehicle-mounted signs

The following signs are used with the illuminated flashing arrow sign:

- 'Workers (symbolic)' (T1-5) shall be used on all vehicles in a mobile works convoy whenever workers on foot are part of the operation; and
- 'Line Marking' should be used on advance warning vehicles and on the work vehicle.

These signs shall be mounted either on the vehicle along with the flashing arrow sign or elsewhere in a prominent position on the body of the vehicle. They shall be removed from view when they do not apply.

### 7.2 Safety barriers

Safety barriers are intended to separate moving traffic from the work area, while providing a safe work area for workers.

Safety barriers may be required for situations where any of the following are cause for concern:

- inadequate safe clearance between moving traffic and workers and plant on site;
- hazardous traffic conflicts;
- collisions with hazardous fixed objects, construction works or falls into excavations close to the travelled path; or
- inadequate separation of temporary footpaths, shared paths or bicycle paths from vehicular traffic paths.

The requirements and recommendations for the selection, positioning and end treatment of safety barriers are given in AS 1742.3.

#### 7.2.1 Containment fences

Containment fences (tapes, plastic mesh fencing or longitudinal channelizing barricades) may be used to provide visible containment and in situations where physical protection by use of a road safety barrier system is not warranted. Containment fences shall have sufficient stability to resist displacement, fracture or deflection of more than 0.5 m resulting from all expected wind conditions, air turbulence from passing traffic and minor vehicular impacts.
Tapes

Containment tapes may be used to contain workers on foot and plant within the safe work area at a work site. The tape should be a minimum 100 mm wide with alternate stripes of contrasting colour and should be supported approximately 1 m above ground level with supports spaced so that the minimum height of the tape above the ground is 800 mm. The maximum breaking strength of the tape should be low enough not to cause a hazard to any vehicle or motor cycle which may run into it. Tapes shall not be used for pedestrian containment adjacent to traffic.

Plastic mesh fencing

Plastic mesh fencing may be used for pedestrian containment as well as for the containment of workers on foot and plant as above. It comprises a flexible orange mesh approximately 1 m high. It shall be supported so that the top of the fence is at least 800 mm above ground level at all times.

7.2.2 Longitudinal channelizing barricades

Longitudinal channelizing barricades shall comprise of interconnected light-weight modules such as plastic water-ballasted modules. They may be used either as containment fences for workers or pedestrians or as delineation devices in situations where a road safety barrier system is not required.

7.2.3 Temporary road safety barrier systems

Temporary road safety barrier systems are designed to provide a physical barrier between the travelled path and the work area which will inhibit penetration by an out of control vehicle and will have redirecting properties. They are typically used between traffic and a severe hazard e.g. a deep excavation, a bridge pier or a hazardous stockpile; and for the protection of workers and non-vehicular road users in vulnerable situations where lateral clearance to moving traffic would otherwise be insufficient for safety. They may also be used to separate opposing traffic.

DPTI ‘Operational Instruction 3.12 - Temporary Safety Barriers’ lists approved products for use on DPTI maintained roads.
7.2.4 Temporary crash attenuators

The need for temporary crash attenuators should be determined through a risk assessment.

Temporary crash attenuators are purposely designed with energy absorbing terminal devices to reduce the severity of a collision by an out of control vehicle with hazardous fixed objects e.g. bridge piers or safety barrier ends.

For attenuator use in SA refer to DPTI’s website located at: http://www.dpti.sa.gov.au/standards/tass

7.3 Pedestrian control

Signs often used for pedestrian control are shown in Table 7.1 below.

<table>
<thead>
<tr>
<th>Table 7.1 Pedestrian control signs</th>

<tr>
<td><strong>PEDESTRIANS WATCH YOUR STEP [T8-1]</strong></td>
</tr>
<tr>
<td>Should be used if pedestrian routes across works may be hazardous due to roughness, level differences, or loose or other surface material.</td>
</tr>
</tbody>
</table>

| **PEDESTRIANS (arrow) [T8-2(L)] or [T8-2(R)]** |
| Shall be used at a work site where it is necessary to direct pedestrians via a particular path. |

| **USE OTHER FOOTPATH [T8-3]** |
| Shall be used where works make it necessary to deny foot-path use on one side of a road. ‘Pedestrian (arrow)’ signs shall be used as necessary in conjunction with this. |

| **FOOTPATH CLOSED [T8-4]** |
| Shall be used if the footpath is not in use. The footpath should be closed with a barrier. |

| **LOOK BOTH WAYS, TWO-WAY TRAFFIC [T8-5]** |
| Shall be used at non-signalised pedestrian crossings on both sides of the open roadway facing pedestrians about to cross if one roadway of a divided road is temporarily closed and there is a risk that pedestrians might not notice it is temporarily two-way.

For further information refer to AS 1742.3 clause 3.10.4.
Mesh fencing
Used to control pedestrian movements at a work site. A safety barrier may be required instead if pedestrians are diverted onto roadway.

7.4 Other signs and devices

Other signs and devices that do not fall into other categories are in Table 7.2.

Table 7.2  
Other signs and devices

Trucks [T2-25] or [W5-22]
Should be used where trucks may cross, enter or leave the road from an adjoining property at a frequency and in circumstances which create a hazard. Should only be displayed when the need exists and removed or covered when truck activity ceases. Should be placed on the side of road where trucks will be crossing or entering from.

High visibility clothing
High visibility clothing meeting the requirements of AS/NZS 4602 (Types D, N or D/N) shall be worn by all visitors and personnel working in or adjacent to traffic (including at work sites, in quarries and on construction haul roads). It is designed to make personnel more conspicuous and warn road users of their presence.

TRAFFIC HAZARD [T1-10]
May be used for emergency use only, whenever any unexpected event causes a traffic hazard. Should be replaced as soon as possible (generally within 24 hours) by signs more appropriate to the conditions.

Lamps
If road lighting is poor or absent at work sites flashing yellow lamps may be used to draw attention to advance warning signs e.g. ‘Roadwork Ahead’ or ‘Bridgework Ahead’. Lamps shall not be used for delineation.

NOTE: The use of steady or ripple lamps is no longer permitted in AS1742.3.
### Portable VMS

VMS's are used as a supplementary sign only and must not replace standard signs.

Refer to ‘Operational Instruction 2.36 - Variable Message Signs’ and AS1742.3 clause 3.16.7

### Two-way Traffic [W4-11] & [T2-24]

Shall be used to warn road users that the roadway carries two way traffic. Should be used where a roadway designed and normally used for one way traffic is temporarily being used for two way traffic and to warn traffic entering from a side road of this condition.

Reference: AS 1742.3 clauses 3.6.8 and 3.16.
Section 8: Works protection methods

A summary of works protection methods is given in Table 8.1.

### Table 8.1: Works protection methods

8.1 Static Work Sites

Note: The clearance to edge of the work area in the following shall be measured from the traffic side edge of the line of delineating devices or barriers.

8.1.1 Hazardous work area – when clearance to traffic is less than 1.5 m and not protected by a road safety barrier system

If a clearance of 1.5 m cannot be achieved then the following minimum requirements apply:

- ‘Workers (symbolic)’ signs in advance of the work area.
- Delineation of the edge of the traffic lane by traffic cones, temporary bollards or similar means.
- Separate delineation of the edge of the work area by means of a containment fence if there is a risk of workers or small items of plant infringing the clearance area. The containment fence may be omitted if there is insufficient space to place it.

A roadwork speed limit of 25 km/h shall be used. However, the traffic speed should be increased to a maximum of 60 km/h where work is carried out on plant exclusively.

8.1.2 When clearance to traffic is more then 1.5 m and not protected by a road safety barrier system

When there is no road safety barrier system between the edge of the work area and the nearest edge of a lane carrying traffic; the following are required when workers or small items of plant are on site. This is in addition to the requirements for other work site management devices specified in AS1742.3:

- ‘Workers (symbolic)’ signs in advance of the work area.
- Delineation of the edge of the traffic lane by traffic cones, temporary bollards or similar means.
- Separate delineation of the edge of the work area by means of a containment fence if there is a risk of workers or small items of plant infringing the clearance area.
- Vehicle mounted warning devices.

A roadwork speed limit of 40 km/h shall be applied.

8.1.3 Work area protected by a road safety barrier system

If the work area is protected by a road safety barrier system, there is no requirement to reduce traffic speed for the protection of workers.
- Advance signing and delineation, including 'Worker (symbolic)' signs are required when workers are on site.
- Steps should be taken to ensure that workers and plant remain within the protection of the barrier.
- A containment fence behind the barrier and temporary crash attenuators should also be used.
- Clearance to edge of barriers:
  - 0.3 m – 40 km/h
  - 0.5 m – 60 km/h
  - 1.0 m – 80 km/h

A temporary roadwork speed limit not exceeding 80 km/h shall be applied for the safety of road users negotiating the site outside the barrier.

8.2 Short-term low impact works

The following treatments are permitted to carry out short-term low-impact works without the use of fully protected static work sites or mobile works convoys. A risk assessment shall be made of these treatments in environments where this type of work is proposed. If the risks cannot be tolerated, a fully protected static work site or mobile works convoy will be required.

A built-up area is defined as: “roadside development comprising property accesses at spacings averaging less than 100 m over distances of at least 500 m”.

An open road area is defined as: “roadside development less frequent than that specified for a built-up area”.

8.2.1 Frequently changing work area – open road areas

For activities such as minor maintenance on the pavement or shoulder, including road furniture maintenance and longitudinal survey work at successive locations less than 2 km apart, the frequently changing work area treatment may be applied.

The following requirements shall be observed:

- workers may work on the roadway or within 1.5 m of moving traffic provided the roadway at any one work site is not occupied for more than 20 minutes;
- display a vehicle mounted warning device (which shall not be obscured);
• sight distance to the vehicle mounted warning device for approaching traffic shall be greater than 150 m in a 60 km/h or lower speed limit zone; or greater than 250 m for speed limits greater than 60 km/h; and
• a lookout person is posted to warn workers on foot on the roadway of approaching traffic (see AS 1742.3 clause 4.3.3 for conditions).

Advance signs up to 2 km in advance of each work position or item of moving plant shall be displayed. The distance between these advance signs for opposing directions of travel shall not exceed 2 km at any time.

At each advance sign location the following signs shall be used:

• ‘Workers (symbolic)’ – where there are workers on foot;
• ‘Road Plant Ahead’ – where moving road plant only will be encountered; and
• ‘Next 2 km’ sign shall be placed with whichever of the above signs is used.

If any of the above requirements cannot be met at a particular location e.g. sight distance is substandard then that site shall be set up as a fully protected short-term work site with advance signs at the standard distances.

8.2.2 Frequently changing work area – built-up areas

Work not within traffic lane

The work shall be carried out with a vehicle equipped with a vehicle mounted warning device parked on a shoulder, parking lane or elsewhere where parking is permitted adjacent to moving traffic.

The vehicle shall shadow the work area at all times, either to the front or behind it. The limitations that shall apply are:

• speed limit – 70 km/h or less;
• minimum sight distance to oncoming traffic – 50 m;
• maximum work period at any one location of 20 minutes;
• a static work site is required if these conditions cannot be met; and
• the work area may move frequently between successive locations.

The following are examples of short-term low-impact works appropriate for this treatment when they do not encroach onto a moving traffic lane:

• pit cleaning or repair;
• litter collection;
• tree pruning or planting;
• road signs or street furniture maintenance; and
- street light maintenance.

Work within a traffic lane

The work shall be carried out using a work vehicle or large plant item and a shadow vehicle, both equipped with a vehicle mounted warning device. A large plant item should generally be considered to be the equivalent of a medium size farm or industrial tractor or larger.

If work is being carried out by a large plant item and there are no workers on foot or small plant items present, the shadow vehicle shall follow the plant item 15 m to 30 m behind it, either in the lane or shoulder to the left of the work lane if free, or otherwise, within the work lane.

If the work is being carried out by workers on foot or small items of plant, even though large plant items may also be present, the shadow vehicle shall travel in the same lane as the work area, 20 m to 40 m behind the work vehicle.

The following limitations apply:

- speed limit – 60 km/h or less;
- maximum work period at any one location, large item of plant, no workers on foot – 20 minutes at any traffic volume;
- maximum work period at any one location, workers on foot – 20 minutes at traffic volumes up to 40 vph;
- the shadow vehicle may be dispensed with at traffic volumes less than 60 vph provided sight distance to oncoming traffic is at least 50 m or 2D, whichever is the greater; and
- the work may be moved between successive locations.

The following are examples of short-term low-impact works appropriate for this treatment:

- pavement marker laying (other than on dividing lines).
- pavement testing.
- any of the following items where encroachment onto a traffic lane is likely to occur:
  - pit cleaning or repair;
  - litter collection;
  - tree pruning or planting;
  - road signs or street furniture maintenance;
  - street light maintenance; and
- a static work site is required if these conditions cannot be met.
8.2.3 Works on medians, verges and footpaths – built-up areas

The following works may be carried out without any support vehicle on the roadway, subject to the conditions listed below:

- median and verge mowing and relating activities such as tilling, seeding and weed spraying;
- works on a footpath; and
- garden maintenance.

The following conditions shall be met:

- Work duration is limited to a single shift.
- Where there are large plant items only and no workers on foot, the relationship between speed limit and clearance to edge of traffic lane shall be as follows:
  - A maximum speed limit of 80 km/h – clearance shall be greater than 1.5 m; and
  - A speed limit 60 km/h or less – clearance may be 1.5 m or less but plant items shall not encroach onto the traffic lane.
- Where there are workers on foot or small items of plant, or both, the work method shall be restricted to one of the following:
  - the speed limit is 60 km/h or less and the work area does not encroach onto a moving traffic lane;
  - the speed limit is 80 km/h or less and the clearance to edge of traffic lane is at least 1.5 m; or
- The ‘Workers (symbolic)’ sign or ‘Road Plant Ahead’ sign shall be displayed respectively, when either workers on foot or plant items alone are present and working closer than 1.5 m to a moving traffic lane.
- Wherever there are workers on foot or small items of plant working 1.5 m or less clear of a moving traffic lane, traffic cones or temporary bollards to the required spacing shall be placed along the kerb line or edge of traffic lane if no kerb.
- A static or mobile work site is required if these conditions cannot be met.

8.2.4 Shoulder grading and mowing on sealed roads – open road areas

Shoulder grading and mowing on sealed roads with traffic volumes less than 1500 vpd may be undertaken in bounds of up to 10 km in length under the following conditions:

- If sight distance to the vehicle mounted warning sign on the grader or mower is at least 250 m throughout the section of road being worked
on, advance signs ‘Road Work Next 10 km’ shall be placed at each end of the section. ‘Loose Stones (symbolic)’ or similar signs may be needed at the beginning and along the section.

- If the sight distance falls to less than 250 m at some locations, ‘Grader Ahead’ or ‘Road Plant Ahead’ together with ‘Next 2 km’ shall be used on each approach to the section covering the location of diminished sight distance. A 60 km/h temporary speed zone will be required if the speed of traffic is 80 km/h or more.
- Subsections of 2 km or less in length created as described in the bullet point above shall be used. All signs, including speed zone signs if used, shall be relocated before proceeding with the next section. If there is difficulty turning a grader around at the end of a 2 km section it may be extended to the next available turning point provided it is not more than 6 km in total length.
- Where traffic volumes are greater than 1500 vpd the works shall be undertaken either as a mobile works or as static work site.

8.2.5 Work between gaps in traffic – open road and built-up areas

Work that is of short duration that can be carried out within gaps in traffic may be done without advance signs or delineation provided that:

- a lookout person who can see approaching traffic in time to warn workers to vacate the work area before its arrival, is posted;
- work vehicles and items of plant are parked clear of a moving traffic lane;
- a vehicle mounted warning device is displayed on the work vehicle; and
- the maximum work period at any one location is 20 minutes.

The lookout person may be dispensed with if the work will not take longer than 10 seconds and approach traffic can be seen for a distance of at least 20 seconds of travel time.

NOTE: In urban areas, this method is not recommended where traffic lane volume exceeds 100 vph unless significant gaps are being created by upstream traffic control such as intersection traffic signals.

8.2.6 Short-term work in traffic – open road areas

Workers with a vehicle or item of plant equipped with a vehicle mounted warning device may work on the roadway or within 1.5m of moving traffic without the use of advance signs provided the roadway at any one work site is not occupied for more than 20 minutes, and the conditions below are met.

Sight distance to the vehicle mounted warning device for approaching drivers shall be:
- speed limits 60 km/h or less – greater than 150 m; and
- speed limits 61 km/h or more – greater than 250 m.

The vehicle mounted warning device shall not be obscured e.g. overhanging vegetation or a raised truck body.

The work shall not reduce the:
- overall width to less than that required for safe passage for two way traffic (or one way traffic if volume is less than 50 vpd); or
- running lane width adjacent to a barrier line to less than that needed to allow vehicles to proceed without crossing the line.

A lookout person shall be posted to warn workers on foot on the roadway of the approach of any vehicles whose speed or size may constitute a safety threat. If two or more work areas within a space of 2 km are to be worked on, the site shall be treated as a frequently changing work area. The lookout person may be dispensed with if the:
- work area is more than 1.5 m clear of moving traffic; or
- work will not take longer than 10 seconds and approaching traffic can be seen for a distance away equal to 20 seconds of travel time.

### 8.2.7 Mobile inspections – open road areas

Mobile inspections are carried out in one of the following ways:
- If the inspection vehicle maintains speed that is less than 20 km/h below the speed limit it may travel in the traffic stream.
- If the inspection vehicle maintains speed that is at least 25 km/h on a road with less than 200 vpd it may travel in the traffic stream but shall display at least one flashing yellow light.
- If the inspection vehicle is able to operate by travelling along a shoulder or verge clear of moving traffic, using gaps in traffic to pass any obstructions in the shoulder or verge, it may operate as a single vehicle but shall display at least one flashing yellow light.
- If the inspection vehicle is required to occupy or partially block a traffic lane continuously at speed slower than 20 km/h below the speed limit or less than 25 km/h on a road with less than 200 vpd, it shall operate within a mobile works convoy.
8.3 Mobile works

Mobile works involve vehicles moving along the roadway continually at a speed significantly lower than other traffic and obstructing traffic lanes. All signs and warning devices shall be displayed on moving vehicles in the convoy.

Mobile works include the following:

- line marking using ride-on plant, self propelled, towed or pushed; and
- pedestrian type line marking and pavement marker laying or removal where a shadow vehicle is used.

8.4 Works on unsealed roads

The following treatments are permitted on unsealed roads in recognition of the generally lower volumes and traffic speeds encountered on those roads than on sealed roads. A risk assessment shall be made of these treatments in environments where this type of work is proposed. If risks cannot be tolerated, a fully protected static work site or mobile works convoy will be required.

These treatments shall not be applied to any road which would normally be sealed but has been left unsealed in the process of construction or reconstruction as a sealed road either temporarily or permanently (e.g. due to economic or climatic factors).

Maintenance grading and resheeting may be carried out either with or without leaving a windrow. Where graded or resheeting material cannot be traversed by traffic, in order to allow traffic to overtake the grader, the grader driver should be instructed to raise the blade from time to time and move forward a short distance to allow the traffic to pass.

Grading on the right side of a road against oncoming traffic should be avoided.

8.4.1 Maintenance grading

Maintenance grading shall be undertaken as follows:

- No advance warning signs are required for either travel direction if there is sufficient room for opposing traffic to pass the grader without it driving off the roadway and the sight distance to the grader's vehicle mounted warning device is at least 250 m throughout the whole section of road being worked on.
If the conditions above cannot be met, then work shall be carried out as follows:

- Work shall not be undertaken in lengths of more than 10 km. The sign ‘Roadwork Next 10 km’ shall be placed at each end.

- For site distances less than 250 m the sign ‘Grader Ahead’ or ‘Road Plant Ahead’ together with ‘Next 2 km’ shall be used at each end of each subsection with a reduction of sight distance of up to 2 km in length. These signs shall be placed at least 100 m in advance of the start of any windrow.

  - Subsections of 2 km or less in length shall be completed and signs such as Speed Zone and End of Zone (if used) shall be removed or relocated prior to starting the next section.

- Freshly graded surfaces with loose materials that may become a hazard shall have road condition signs erected. Depending on the type of hazard one or more of the following signs are required:

  - ‘Slippery (symbolic)’;
  - ‘Loose Stones (symbolic)’; and/or
  - ‘Loose Surface’.

### 8.4.2 Maintenance resheeting

Maintenance resheeting shall be undertaken as follows:

- The work shall not be undertaken in lengths of more than 10 km. The sign ‘Roadwork Next 10 km’ shall be placed at each end of the section being worked on.

- For site distances less than 250 m the sign ‘Grader Ahead’ or ‘Road Plant Ahead’ together with ‘Next 2 km’ shall be used at each end of each subsection with a reduction of sight distance of up to 2 km in length. These signs shall be placed at least 100 m in advance of the start of any windrow.

  - Subsections of 2 km or less in length shall be completed and signs such as Speed Zone and End of Zone (if used) shall be removed or relocated prior to starting the next section.

- Freshly graded surfaces with loose materials that may become a hazard shall have road condition signs erected. Depending on the type of hazard one or more of the following signs are required:

  - ‘Slippery (symbolic)’;
  - ‘Loose Stones (symbolic)’; and/or
  - ‘Loose Surface’.
8.4.3 Short-term partial road closures

Advance warning signs may be omitted from short-term partial road closures at works on unsealed roads under the following conditions:

- approaching traffic can see the vehicle mounted warning device from at least 250 m;
- no traffic controller is required in accordance to AS 1742.3 clause 4.13.1(i);
- and either:
  - traffic volume is less than 20 vpd; and/or
  - there is sufficient room for two way traffic past the work area.

A single traffic controller may be used at works on unsealed roads under the following conditions:

- traffic volume is less than 20 vph;
- the single traffic lane section does not exceed 50 m in length; and/or
- the traffic controller has sufficient sight distance of traffic approaching from both directions when situated at one end of the job.

If the above conditions cannot be met the works shall be treated in the same way as sealed roads.

8.5 Night works

Work carried out at night presents higher risks than day light work so extra care is required.

The following requirements apply to works at night or work that extends to more than a single day, i.e. long-term works.

8.5.1 Night conditions

The following requirements apply whether or not workers or plant are on site:

- Wherever practicable, light the entire work area and the immediate approach. Footpaths, hazards or barriers may need to be lit.
- All signs and devices shall be retroreflective. Signs required to be fluorescent by day shall have a sign face background that is also fluorescent. Signs outside of headlight beams shall be floodlit.
- Flashing lamps may be used to draw attention to advance signs.
- Flashing lamps shall not be used for delineation.

For further information refer to AS 1742.3 clause 2.3.6.
• Temporary bollards and traffic cones shall have a retroreflective band for night use.

• On works extending overnight or being conducted at night where an obstruction encroaches onto the roadway, a series of T5-4 Temporary Hazard markers shall be used in lieu of traffic cones or temporary bollards to form the taper guiding traffic away from the obstruction. The markers should be spaced so that as the taper is approached they appear as a continuous line.

• The T5-5 Temporary Hazard markers may be used on works extending overnight, instead of the T5-4 marker, in confined areas where there is not enough space to use the wider marker.

8.5.2 Work in progress at night

In addition to the requirements above the following apply when works are being carried out at night:

• Lighting at a work site shall, as a minimum, illuminate the following:
  ➢ locations where workers or plant may encroach traffic lanes;
  ➢ intersections in which works are taking place; and
  ➢ any traffic controller positions.

• Workers shall wear high visibility clothing.

• Check that signs and devices can be seen by drivers when affected by the glare of site lighting and approaching vehicles. This may involve adjusting the illuminated flashing arrow signs and matrix type variable message signs when in use at night.
Section 9: Installing, operating and removing traffic guidance schemes

9.1 Installing traffic guidance schemes

9.1.1 Condition of devices

Before installing signs and devices, they shall be checked to ensure they are in good condition and their performance is not impaired, in particular:

- Mechanical condition – items that are bent, broken or have surface damage shall not be used.
- Cleanliness – items shall be free from accumulated dirt, road grime or other contamination.
- Colour of fluorescent signs – fluorescent signs that have become faded to a point where they have lost their impact shall be replaced.
- Night-time visibility – signs required to be effective at night shall be checked for retro reflectivity as soon as possible after installation. If retro reflectivity is degraded, either from long use or surface damage, they shall be replaced. Night-time effectiveness is best checked by viewing the signs by vehicle headlights set on low beam in dark conditions.

Important basic principles to be observed are as follows:

- signs and devices shall be installed by a ‘competent person’;
- signs and devices shall be appropriate to the conditions at the work site and shall be used in accordance with AS 1742.3 unless a risk assessment undertaken by a competent person indicates that an alternative arrangement is satisfactory;
- signs and devices shall be erected and displayed before work commences at a work site;
- signs and devices shall be regularly checked and maintained in a satisfactory condition;
- signs and devices shall be removed from a work site as soon as practicable with only appropriate signs remaining in place until all work has been completed; and
- where works require the relocation of regulatory traffic control items, they shall be relocated or reinstalled promptly in positions where they are visible and can perform their regulatory function.
9.2 Sign mountings

Mountings for signs are required to suit a wide variety of situations.

For short-term operations, signs and mountings should be:

- quick and easy to install;
- provide a secure sign attachment;
- stable in windy conditions and from the effects of moving traffic;
- suitable to instal on all types of road, shoulder or verge surfaces;
- able to handle the sizes of signs involved;
- easily handled, transported and stored;
- not hazardous to road users if struck; and
- prominently displayed (see below for heights and locations).

Signs for long-term work should be mounted on regular fixed supports so that they are not likely to be disturbed by weather, vandals or traffic.

9.2.1 Portable supports

Signs mounted on portable supports used for short-term operation should generally be located as follows:

- Open road areas – on the road shoulder a minimum of 1 m clear of the travelled way.
- Built-up areas – behind the kerb if visible to oncoming traffic and not obstructing pedestrians, otherwise on the pavement as near as practicable to the kerb without obstructing the sign or traffic.

9.2.2 Post mounting

Signs mounted on posts should be located:

- Open road areas – clear of the shoulder’s outer edge and at least 2 m clear of the travelled way (whichever is greater) and minimum of 1.5 m between the travelled path and sign’s underside.
- Built-up areas on unkerbed roads – clear of the shoulder’s outer edge and at least 2 m clear of the travelled way (whichever is greater) and minimum of 1.5 m between the travelled path and sign’s underside.
- Built-up areas adjacent to a footpath or where vehicle parking may occur – a minimum of 300 mm behind the kerb and a minimum of 2.2 m between the kerb or footpath and the underside of the sign.
9.3 Positioning of signs and devices

Signs and devices shall be positioned and erected so that they:

- are properly displayed and securely mounted;
- are within the line of sight of the road user;
- cannot be obscured from view, e.g. by vegetation or parked cars;
- do not obscure other devices from the line of sight of road users;
- do not become a potential hazard to workers, pedestrians or vehicles;
- do not deflect traffic into an undesirable path;
- do not restrict sight distance for drivers entering from side roads, streets or private driveways; and
- are not installed using supports that could be a hazard if struck by vehicles, i.e. supports shall be constructed using frangible materials.

Where an instruction sign and a road condition sign are required in the same place; install the instruction sign first and then find the most effective place to install the road condition sign.

The visibility of a sign can be affected by deep shade, the direction of sunlight, background conditions (including lighting) and headlights. These factors should be considered when signs and devices are erected to ensure that they can be clearly seen at all times.

9.3.1 Edge clearances

The clearance between the edge of the traffic lane to delineating devices or road safety barrier systems shall be determined as shown in Table 9.1.

This clearance shall be measured to the edge of the delineating device or barrier closest to traffic. Additional requirements for edge clearances are provided in AS 1742.3 clause 4.13.4.
9.4 Setting out devices

Before work commences, signs and devices at the approaches to and within the work area should be set out in accordance with the traffic guidance scheme in the following sequence:

- Advance warning and regulatory signs.
- All intermediate advance warning and regulatory signs and devices required in advance of the taper or start of work area.
- All delineating devices to form the taper including an illuminated flashing arrow sign at the end of the taper where required.
- Work area or side track delineation.
- All other warning and regulatory signs required including termination and end of temporary speed zone signs.

Signs and devices that are erected before they are required shall be covered by a suitable opaque material. Open weave materials such as hessian or dark coloured plastic materials are not suitable. Best results are obtained by using a dense fabric that allows entrapped moisture such as condensation, to dissipate in a natural manner.

The cover shall be removed immediately prior to the commencement of work.

Signs should also be checked in unusual weather conditions including high winds for loss or disturbance of the covering.

Table 9.1: Edge clearances for delineating devices and road safety barrier systems

<table>
<thead>
<tr>
<th>Device</th>
<th>Traffic speed</th>
<th>Edge clearance *</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic cones, bollards or longitudinal channelizing barricades</td>
<td>60 km/h or less</td>

<td>Greater than 80 km/h</td>
<td>2.0 m</td>
</tr>
</tbody>
</table>

Note (*): In the absence of marked lines these clearances shall be added to the nominal lane widths specified in AS 1742.3 clause 4.13.3.

Reference: AS 1742.3 clause 4.13.4
9.4.1 Placement of signs for detours

Installation for the ‘uncovered process’ should be undertaken as follows:

- Install the last sign that vehicles will see, i.e. the sign at the end of detour. Then, working back towards the start of the detour, install the remaining signs. Vehicles are able to detour only when all signs are present.

Another option is the ‘covered process’ where signs are covered until required.

A ‘competent person’ shall drive the detour path to verify the signs are clear and that the vehicle types and volume of traffic are able to travel the detoured path.

Removal of the detour signs should be undertaken as follows:

- Signs from the beginning of the detour route.
- Other signs along the route.

9.4.2 Orientation of signs

Signs should face towards oncoming traffic, approximately at right angles in line with the sight of the driver. On curved alignments, the correct angle should be considered from the point 50 m in advance of the sign.

9.4.3 Inspection

Once the signs and devices have been erected at a static work site, a ‘competent person’ shall carry out a functional inspection on site. The inspection should be carried out from within the traffic stream travelling at the posted speed limits. If unsatisfactory, it should be adjusted and reinspected.

Night inspections should be carried out with vehicle headlights set on low beam.

9.5 Operation

9.5.1 Work site records

A daily routine for the operation of a work site shall be implemented and maintained, including the keeping of daily records of:

- the sign and delineation arrangements or traffic guidance scheme;
- any changes to signs and devices as work circumstances or road conditions dictate; and
- any incidents which might have ongoing consequences.
9.5.2 Layout variation

Cover or remove any signs or devices that are no longer needed. Add signs and devices as work circumstances or road conditions dictate. When all workers leave a site the ‘Workers (symbolic)’ sign shall be removed. Keep a record of any such changes on daily work sheets or in a diary.

9.5.3 Maintenance of signs and devices

Signs and devices shall be kept clean.

Damaged or ineffective signs and devices shall be refurbished to new condition or replaced. Non repairable signs should be destroyed to avoid reuse.

Required water levels shall be maintained in water-filled safety barrier elements.

9.5.4 High visibility clothing

High visibility clothing shall comprise of at least the following:

- For day time use – type D or D/N jacket or vest in fluorescent red, orange or yellow. Care should be taken to select the appropriate colour in order to obtain the best visual contrast particularly for vulnerable workers, e.g. traffic controllers.
- For night time use – type N jacket or vest with a minimum area of 450 cm² of white or yellow retroreflective material visible on the upper torso to front and to rear. Fluorescent material, which is not also retroreflective, does not give adequate conspicuity at night.

Combination fluorescent and retroreflective material may be used for dual purpose garments provided the above requirements are met.

In wet weather conditions, conspicuous wet weather clothing that meets the same colour requirements as above shall be used.

High visibility clothing shall be worn over other clothing and shall be fully fastened to display the entire available area of high visibility material for each direction of observation.

9.5.5 Hazard avoidance

Machinery should not be parked, materials stored or buildings erected in positions where they may create a hazard, obscure signs or block approaching drivers’ lines of sight.
9.5.6 Delays

If an excessively long delay is caused by an unexpected event e.g. plant breakdown, the supervisor should inform the traffic controllers of the delay and give an estimated time to be relayed to the public. Advice should also be given to emergency services. If traffic queues become too long, consideration should be given to either finding a suitable detour or otherwise re-routing traffic.

9.5.7 Safety audit

Periodic safety audits of roadworks treatments should be undertaken to ensure compliance to documented requirements. See Appendix C for an example of a safety audit form.

Consider a construction phase road safety audit for complex traffic arrangements or staged works.

Refer to Road Safety Audit – HB 43 (AUSTROADS).

9.6 Daily routine tasks

Supervisory personnel should establish a daily routine that allocates specific tasks to personnel and supervisors working on roads. This is to make sure that:

- signs and devices are adequate for the safety of personnel and traffic at all times;
- travelling surfaces are maintained in a satisfactory condition;
- plant operations are not disrupted; and
- loss of production time is minimised.

The supervisor's role in this routine is coordination, inspection and correction.

The following daily routine is an example of the activities that should be undertaken.

9.6.1 Before work starts

- Inspect all traffic signs and devices and make a note of signs out of place or damaged during the night for subsequent rectification.
- Check all lamps and if necessary clean them.
- Inspect all water ballasted safety barriers or containment fence modules and make a note on any out of position modules, low water levels and damaged modules for subsequent rectification.
- Check for safety and effectiveness of any adjustments made by an inspection drive through of the site and make a record of the signs erected and their locations.
9.6.2 During hours of work

- Periodically drive through the work site to check that all signs, markings and delineating devices seen by other road users are satisfactory and in their correct position.
- Attend to minor problems as they occur.
- During work breaks e.g. tea breaks:
  - move personnel clear of the work area;
  - park plant clear of traffic lanes; and
  - if workers leave the site or cannot be seen, remove from view any inappropriate signs such as ‘Prepare to Stop’ or ‘Workers (symbolic)’.
- Where there are traffic hazards or where only one lane is open to traffic, instruct traffic controllers to remain on the job and relieve them as necessary.

9.6.3 Closing down at the end of the day

- Carry out a pre-closedown inspection, allowing time for urgent maintenance to the travelled path.
- Remove ‘Prepare to Stop’, ‘Workers (symbolic)’ and other inappropriate signs.
- Drive through the work site to confirm signs, devices and delineators are in position and operating before leaving the site.
- Record any changes.
- Special provisions such as traffic controllers working in shifts, illumination of the site or traffic signals installation are required if:
  - less than one lane in each direction is available after working hours, during weekends or holidays; or
  - the traffic flow in one direction on a multi-lane highway exceeds the figures shown in Appendix B for the number of lanes available.
- Also Refer to Clause 4.9.1 (Risk Assessment).

9.6.4 After hours (when work is suspended)

- Carry out periodic after dark inspections on low headlight beam to ensure that all signs and devices are visible and performing their correct function.
- Provide an after hours contact so that arrangements can be made to replace damaged signs, delineators or barriers.
Ensure that a record is kept of signs found damaged, missing or out of place (and their location) at night, on weekends or during holiday inspections.

9.7 Performing traffic control

9.7.1 Duties of traffic controller

The duties of a traffic controller shall include the following:

- be an ‘accredited officer’ i.e. have attained accreditation in a DPTI approved Workzone Traffic Management training course;
- wear high visibility clothing;
- set up and remove ‘Prepare to Stop’ signs;
- be located where sight distance is no less than 1.5 $D$ to traffic;
- not obstruct or be obstructed by other signs and devices;
- to stand alone;
- have a clear escape path i.e. work out what you would do if a vehicle came towards you and appeared not to be stopping;
- if working with another controller and you are next to stop traffic, fulfill your responsibility to change the direction of traffic;
- use an ‘A’ size Stop/Slow Bat’ (unless a book barrier is used);
- use portable two-way radios or other suitable equipment to communicate between controllers if unable to do this by sight;
- give definite and clear hand signals (see figures in AS 1742.3);
- make sure you stand clear of traffic before allowing it to proceed;
- take care you do not display a ‘Stop’ sign to traffic by mistake;
- take at least a 15 minutes break after no more than 2 hours duty;
- not leave the position unless relieved by another ‘accredited person’ or directed by the supervisor; and
- be courteous at all times in dealing with the public, never let yourself be provoked.

9.7.2 Control of approach speed

In the first instance an appropriate roadwork speed limit zone shall be established to protect traffic controllers. In most situations the positions where a traffic controller will be required to operate will create a hazardous work area.
9.8 Operating portable traffic signals

The following guidelines apply to the operation of portable traffic signals:

- vehicle-actuated operation allows the signals to operate automatically in response to vehicle demands. This is the preferred mode;
- fixed-time operation does not respond to vehicle demand. Cycle times are a fixed length; or
- manual operation allows operation of signals by a traffic controller.

Irrespective of the form of operation, signals shall be monitored to ensure they are operating safely and effectively and don’t cause unnecessary traffic delays.

9.8.1 Approach conditions and speed

Sight distances for portable traffic signals shall be a minimum of 150 m to the primary signal face. A roadworks speed limit no higher than 60 km/h shall be imposed if the signals would otherwise be in a higher speed limit zone.

9.9 Removal of devices

It is important that all signs and devices which are no longer relevant are removed or concealed from view as soon as the activity is completed or the hazard ceases to exist.

Removal of devices at the conclusion of the work should be done in the reverse order as for setting out, that is:

- All other warning and regulatory signs including termination and end of temporary speed zone signs.
- Work area or side track delineation.
- All delineating devices to form the taper including an illuminated flashing arrow sign at the end of the taper where required.
- All intermediate advance warning and regulatory signs and devices required in advance of the taper or start of work area.
- Advance warning and regulatory signs.

Reinstate any permanent traffic control devices that were altered or covered during the work program.
Section 10: Appendices
Appendix A  Notification of Works Impacting DPTI Roads

NOTIFICATION OF WORKS IMPACTING DPTI ROADS

To be completed by organisations proposing to undertake works on or adjacent to a road under the care and control of DPTI which may impact on traffic flow and management.

Please post or fax this form to:

Manager, Metropolitan Region  
DPTI, PO GPO Box 1533, Adelaide SA 5001  
Facsimile:  (08) 8226 8329  Telephone:  1800 018 313  
Email:  dpti.tmc@sa.gov.au (email preferred)

Regional Manager, Eastern  
DPTI, 121-129 Thomas Street, Murray Bridge, 5253

</tbody>
</table>

* Right turns out of the single lane may need to be prohibited depending on the proportion of heavy vehicles and the volume of opposing traffic.

Reference: AS 1742.3 table 4.10

NOTE: Volumes shown in the Tables may need to be reduced by the amount shown if the following apply:
(a) Pavement surface is rough or unsealed – reduce volume by 30%.
(b) Horizontal geometry is reduced to speeds below 40 km/h – reduce volume by 50%.
(c) Volume of heavy vehicles exceeds 10%:
   (i) downward, level or easy upgrade – reduce traffic volume by 20%; and
   (ii) sustained upgrades greater than 5% – reduce traffic volume by 40%.
