Message from the Executive Director

Level Crossing Safety Strategy

Safety at railway level crossings is an important issue for road users, train passengers, train drivers and their crew. Every year in Australia, an average of 37 road users, vehicle occupants and pedestrians, die as a result of collisions with trains at railway level crossings.

The number of people killed or injured in level crossing crashes in South Australia, is relatively low. However events such as the Kerang-Victoria level crossing crash show the potential for catastrophic results demonstrating the need for ongoing commitment to effective countermeasures.

The South Australian government, in partnership with rail track owners and operators and local councils, is developing ways to reduce the number of crashes and fatalities at railway level crossings, through investment in infrastructure improvements at railway level crossings and education and enforcement programs aimed at modifying vehicle driver and pedestrian behaviour.

Over the next three years an unprecedented level of funding will be allocated to level crossings. Up to $11 million will be invested by the State Government in engineering, education and enforcement around level crossings. This includes the $500,000 Level Crossing Black Spot program. In addition, $13.6 million has been secured through the Federal Government’s Boom Gates for Rail Crossings program.

South Australia was the first State in Australia to roll out a ‘More Than One Train’ warning system. In all, the warning signals will be installed at 17 sites across the network. South Australia was also actively involved in developing and implementing a national rail safety media campaign, extending this further to emphasise heavy vehicle safety at railway level crossings.

I commend the State Level Crossing Safety Advisory Committee in developing the South Australian State Level Crossing Safety Strategy and three-year action plan for managing the safety risks at railway level crossings and look forward to working with them to implement the action plan over the coming years.

Phil Allan
Executive Director
Safety and Regulation Division
Department for Transport, Energy and Infrastructure
Objective:
To reduce the number, cost and trauma of crashes (and near-misses) at rail level crossings by the most cost-effective means.

Actions include:
- Rolling out red-light camera technology at selected rail level crossings.
- Continuing to roll out ‘boom gates and flashing lights’ at level crossings.
- Working with local councils to rationalise and close selected high risk level crossings.
- Funding a Level Crossing Black Spot program in partnership with local councils.
- Continuing the installation of automated pedestrian gates and the ‘More Than One Train’ warning system at suburban pedestrian rail crossings.
- Supporting education campaigns including targeted enforcement campaigns by South Australia Police (SAPOL) to discourage bad behaviour at level crossings.
- Establishing interface agreements between track owners and the road authority to manage level crossing risks.
- Investigating new signalling and telecommunications technologies.
Introduction

The State Level Crossing Strategy Advisory Committee (SLCSAC) was established in 2003 to improve the coordination efforts between Government agencies and key stakeholders in improving level crossing safety, and to act as an advisory body to the Minister for Road Safety.

The Committee focus on fundamental strategies and policies to promote and assist the relevant road and rail infrastructure managers with the continuous improvement of safety to reduce crash trauma at level crossings in South Australia.

The SLCSAC meets four times a year and is chaired by the Department for Transport, Energy and Infrastructure (DTEI). Membership comprises of representatives from the following organisations:

- Australian Rail Track Corporation
- Australian Rail, Tram and Bus Industry Union
- Heritage Rail SA Inc
- Department for Transport, Energy and Infrastructure
- Genesee & Wyoming Australia
- Great Southern Railway Limited
- Local Government Association
- Pacific National
- Royal Automobile Association
- South Australia Police
- TransAdelaide.

The 2010-2012 Railway Level Crossing Safety Strategy is based on the 3E’s – education, enforcement and engineering. The strategy will guide decision making and recommendations to the Minister for Road Safety.

State funds of up to $11 m have been allocated over the next three years for engineering treatments at level crossings, an education and advertising campaign, the Black Spot program (a matching fund with local government) and proposed safety camera installations. In 2009/10 the State funds for engineering treatments will be supplemented by the Commonwealth funded Boom Gates for Rail Crossings program.
Objective

Risks at level crossings exist for all road users including motorists, motorcyclists and pedestrians of all ages.

The objective for this strategy is to reduce the number, cost and trauma of crashes (and near-misses) at rail level crossings by the most cost-effective means.

Scope of strategy

This document summarises the State Level Crossing Strategy Advisory Committee’s strategy for improving the management of safety risks at railway level crossings. Level crossing safety management is the responsibility of the relevant road authorities and rail infrastructure managers, under the requirements of the Rail Safety Act 2007.

The strategy focuses on catastrophic accident and fatality risks as a result of crashes between road users and rail vehicles.
Level crossings are the point at which road and rail/tram meet and represent the single biggest source of railway and road catastrophic crash risk. Traffic control for road users varies from ‘passive’ signage to ‘active’ protection, which is a combination of lights, bells or lights and boom gates. There are 952 public access railway level crossings in South Australia, of which only 17 percent have active protection.

Research into level crossing crashes by the Australian Transport Safety Bureau (April 2008) found that unintended driver error was more common in fatal railway crossing crashes than in other fatal road crashes (46% compared with 22% of other fatal road crashes). Human factors such as driver inattention, driver distraction, risk taking and disobeying warning signage have been identified as common contributors to vehicle-train level crossing crashes. Additionally it was found that most crashes occur where the driver has a local knowledge and understanding of the railway level crossing. Every level crossing incident has the potential for significant human and financial loss.

The risk of a level crossing accident is almost exclusively the result of the road user, whether in a vehicle or on foot. Whilst infrastructure improvements will continue to reduce risk at railway crossings, increased awareness about the consequences of inattentive or risky behaviour by drivers, riders and pedestrians at railway level crossings need to be encouraged. Education about railway crossing safety is essential to address community attitudes, road user complacency and high-risk behaviour at railway crossings.

South Australian Level Crossing Safety Strategy and Action Plan

Situation analysis
Level crossing definitions

A level crossing is a location where a public or private roadway, footpath, or both, crosses one or more railway/tramway tracks.

Level crossings are provided with various levels of traffic control.

Crossing with Active Warning Devices
Control of movement of vehicles or pedestrians across a railway level crossing by devices such as flashing light signals, bells or other audible warning devices, gates or barriers, or a combination of these, where the device is activated prior to and during the passage of a train or tram though the crossing.

Crossing with Passive Warning Devices
Control of the movement of vehicles or pedestrians across a railway level crossing by signs or devices, none of which are activated during the approach or passage of a train or tram, and which rely on the user detecting the approach or presence of a train by direct observation.

Unprotected level crossing
No active or passive warning of any kind provided. This is usually a field or farm crossing.

Level crossing fatalities

From January 2001 to December 2009 there have been 22 rail fatalities and 74 serious injuries in South Australia. During this same period there have been 84 road vehicle collisions at level crossings.

Strategic approach

The State Level Crossing Strategy Advisory Committee has a long-term aim to develop recommendations for the Minister for Road Safety to reduce crash trauma at level crossings in South Australia.

Over the 2010-2012 period the focus will be on:
- Promoting level crossing safety as a road safety issue, linking into road safety messages and campaigns.
- Using current level crossing laws and technologies to support best practice.
- Working closely with the rail industry to help improve level crossing safety.
- Encouraging local councils and other stakeholders to take action to improve safety at level crossings.
- Governing the cooperative relations between all stakeholders.

The State Level Crossing Strategy Advisory Committee will achieve these aims by:
- Targeting resources on areas which present the greatest risk, or greatest potential for improved control.
- Supporting level crossing closures or replacement of high risk crossings.
- Promoting safety standards for level crossing design and upgrade, based on research and best practice.
- Continuing to support research and promotion for risk awareness and user behaviour, including national projects.
- Education and enforcement that generates awareness of the risks presented by level crossings.
- Implementing nationally consistent initiatives that support sharing best practice and identifying opportunities to reduce the catastrophic risk of level crossing crashes.

Implementation

The strategic areas of action are supported by the detailed Action Plan. Relevant stakeholders and the responsible agency are highlighted within the plan. The plan will be monitored and reported on at each SLCSAC meeting.

The ongoing liaison and investment of all stakeholders who have an interest in achieving the goals of this strategy will help to ensure its success.
### Issue | Strategy
---|---
**Education**<br>Fund and manage media campaigns, including supporting the national education campaign.<br>Incorporate level crossing safety into existing pre-school, primary and secondary school road safety education packages.<br>Actively participate in National Rail Safety Week.<br>Liaise with road freight industry groups regarding rail safety proposals and improving user behaviour.<br>Incorporate level crossing safety into road safety strategies and training programs, eg. Novice driver licensing.<br><br>**Enforcement**<br>Work with SAPOL to identify and target police enforcement at rail industry identified black spots.<br>Further develop the application of red-light camera technology at rail level crossings and successfully prosecute offenders to reduce crossing misuse.<br>Assess the effectiveness of cameras being trialled on locomotives for data collection.<br><br>**Engineering**<br>Develop a detailed policy statement for level crossing rationalisation.<br>Implement the level crossing upgrade program.<br>Review and risk assess private level crossings.<br>Secure consideration of level crossing issues in local council planning decisions through the Black Spot funding program.<br>Investigate new signalling and telecommunications technologies assessing suitability and on-going maintenance of level crossings.<br><br>**System management**<br>Continue to support the use of the Australian Level Crossing Assessment Model (ALCAM).<br>National benchmarking and knowledge sharing on level crossing safety for State programs and actions.<br>Carrying out risk assessments and safety audits examining safety management arrangements and crossing conditions.<br>Working with and supporting track owners and road authorities in their actions to reduce level crossing risk.<br>Development and implementation of information management and reporting systems to improve efficiency in relation to level crossing activities.
